

DIAGNOSING Network Failures

WITH KEITH PERKINS

Network Failures & Diagnosis

“What we have here, is a failure to communicate!”

Course Outline

Defining what a network is

Outline common network design and architecture

Cover useful tools for network diagnosis

Outline a diagnostic process

Cover wiring diagram interpretation and understanding

Outline common network failures

What's In an OBD2 Port?

An OBD-II compliant network can use any of the five COMMON communication protocols:

J1850 PWM – Typically Ford

J1850 VPW – Typically GM

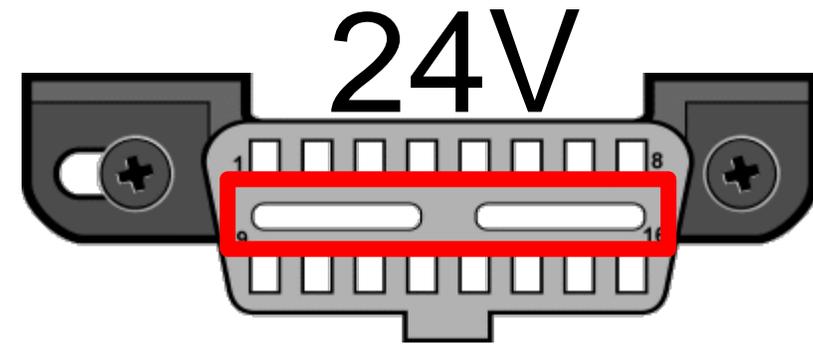

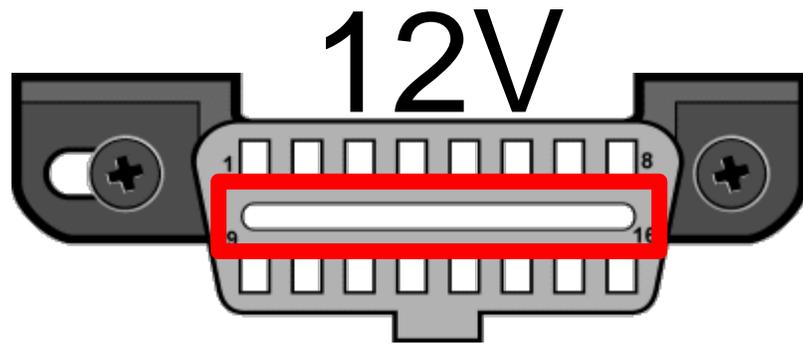

ISO9141-2 – Typically Chrysler, Euro, and Asian vehicles

ISO14230-4 (AKA KWP 2000) - Typically Chrysler, Euro, and Asian vehicles

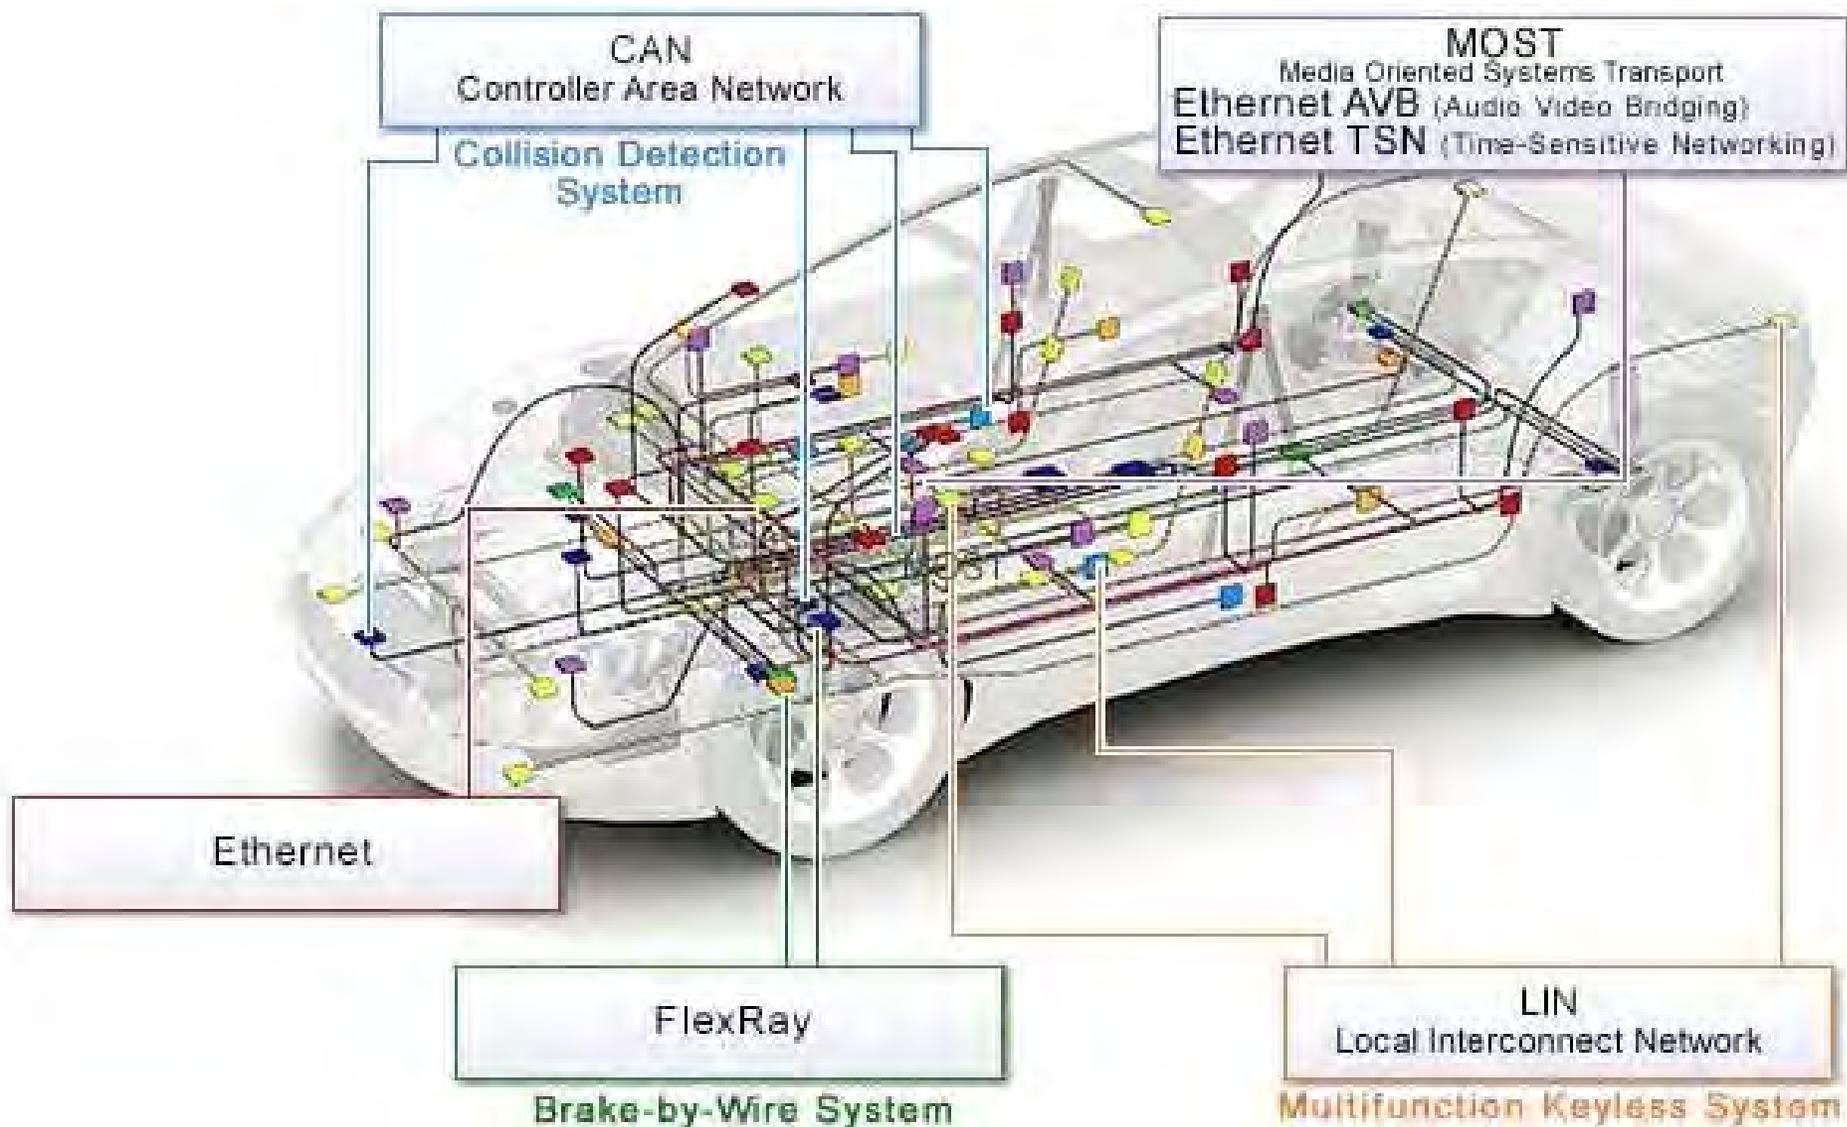

ISO15765-4/SAE J2480 (A “type” of CAN)

As of model year 2008 to Present, MOST vehicles will use the CAN protocol. (ISO15765-4)

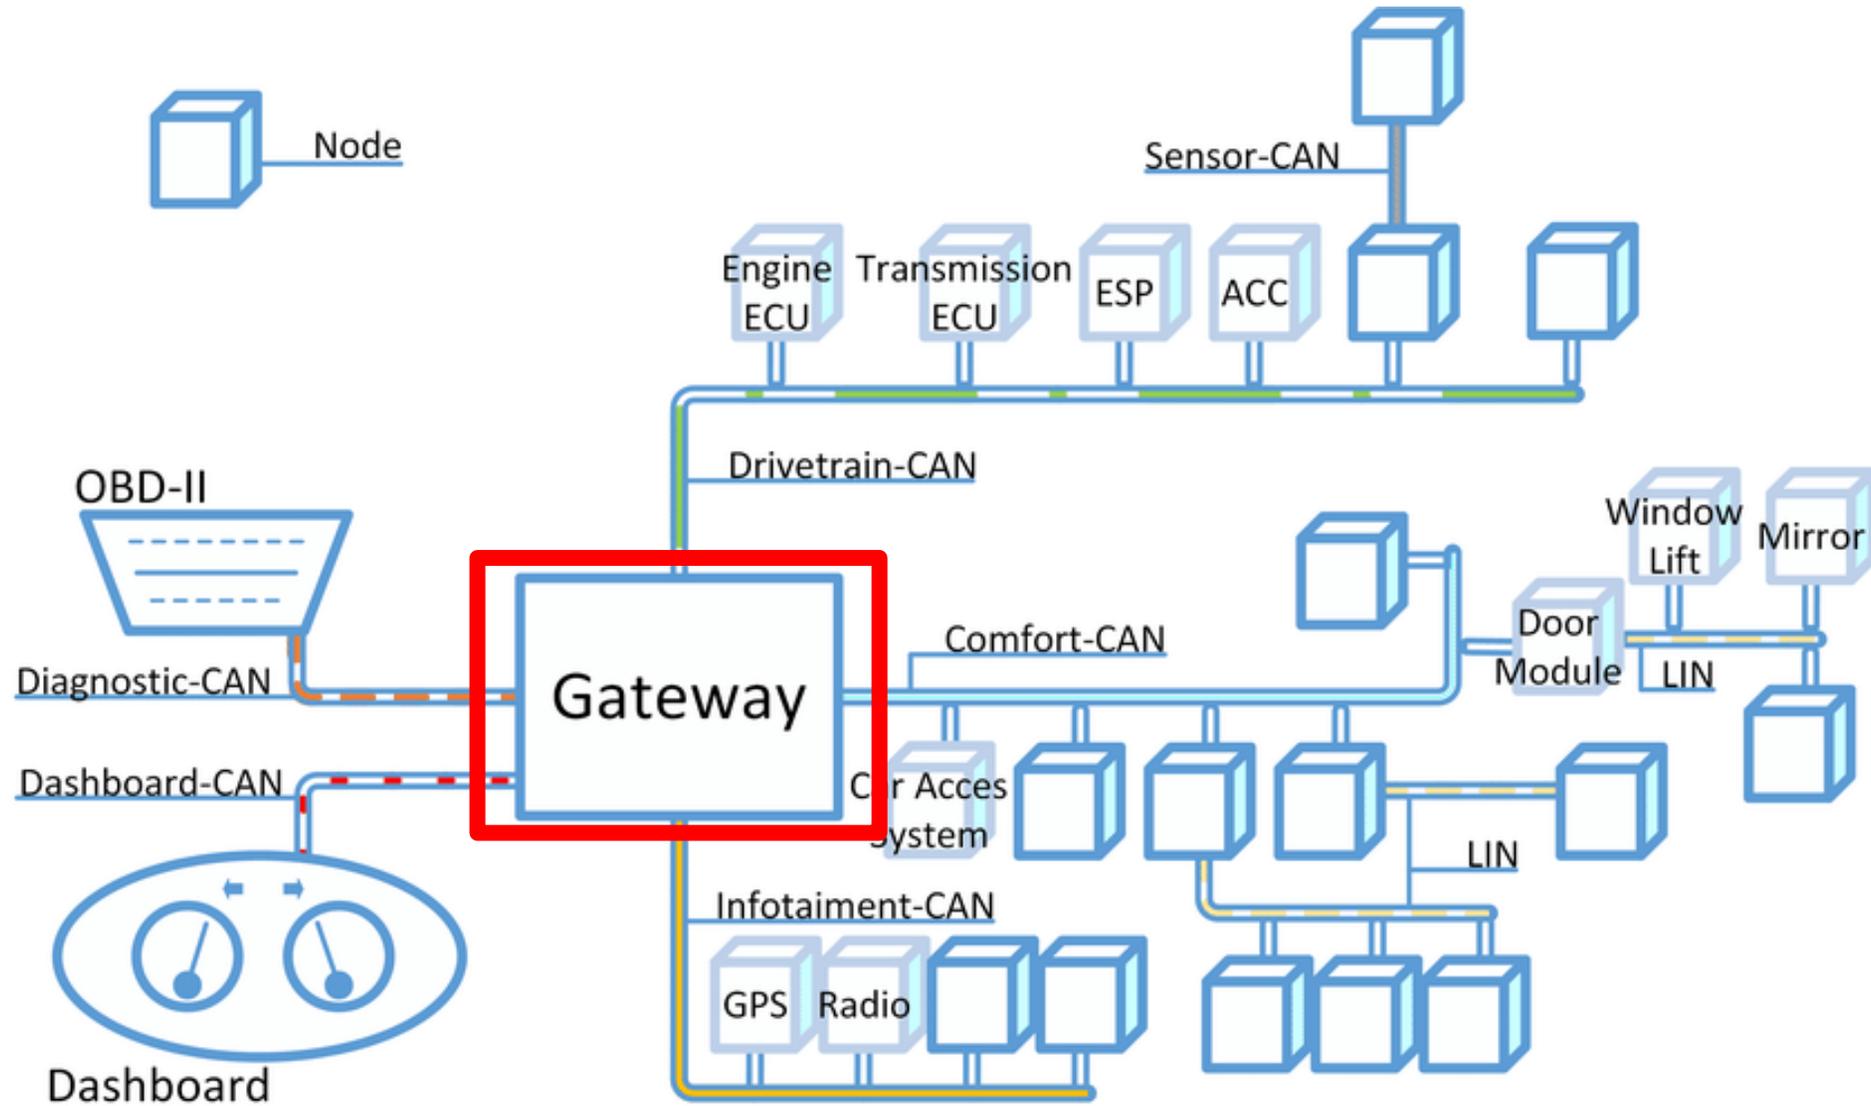

There are two types of diagnostic link connectors (DLCs) defined by SAE J1962 - Type A and Type B

What is in a vehicle?

Gateways (Generic BMW)

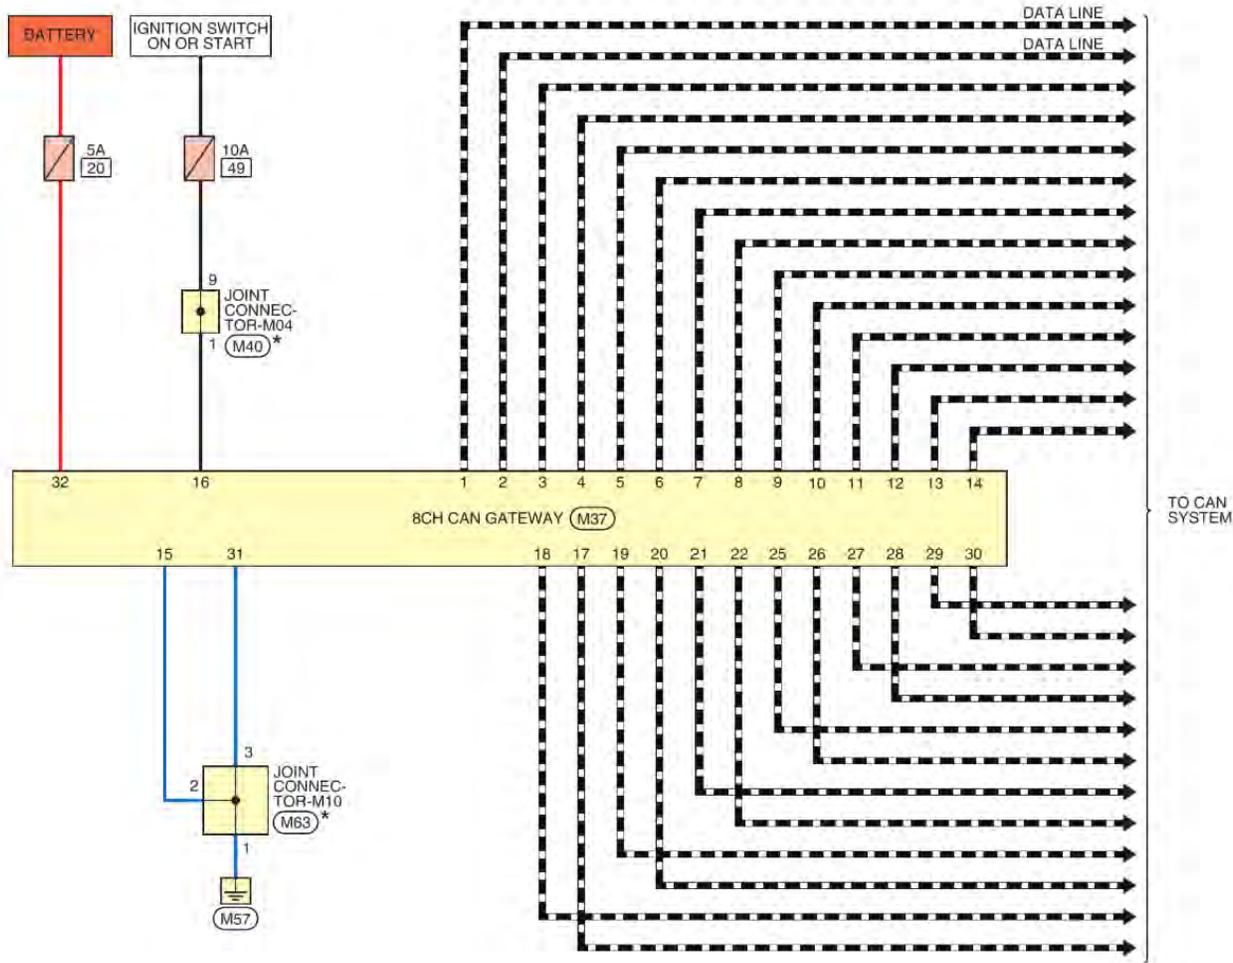

Gateways (2021 Nissan Sentra)

8CH CAN GATEWAY SYSTEM

REFER TO POWER SUPPLY, GROUND & CIRCUIT ELEMENTS SECTION FOR COMPLETE POWER SUPPLY DETAIL.

--- : CAN COMMUNICATION LINE FOR DIAGNOSIS

Gateway Access:

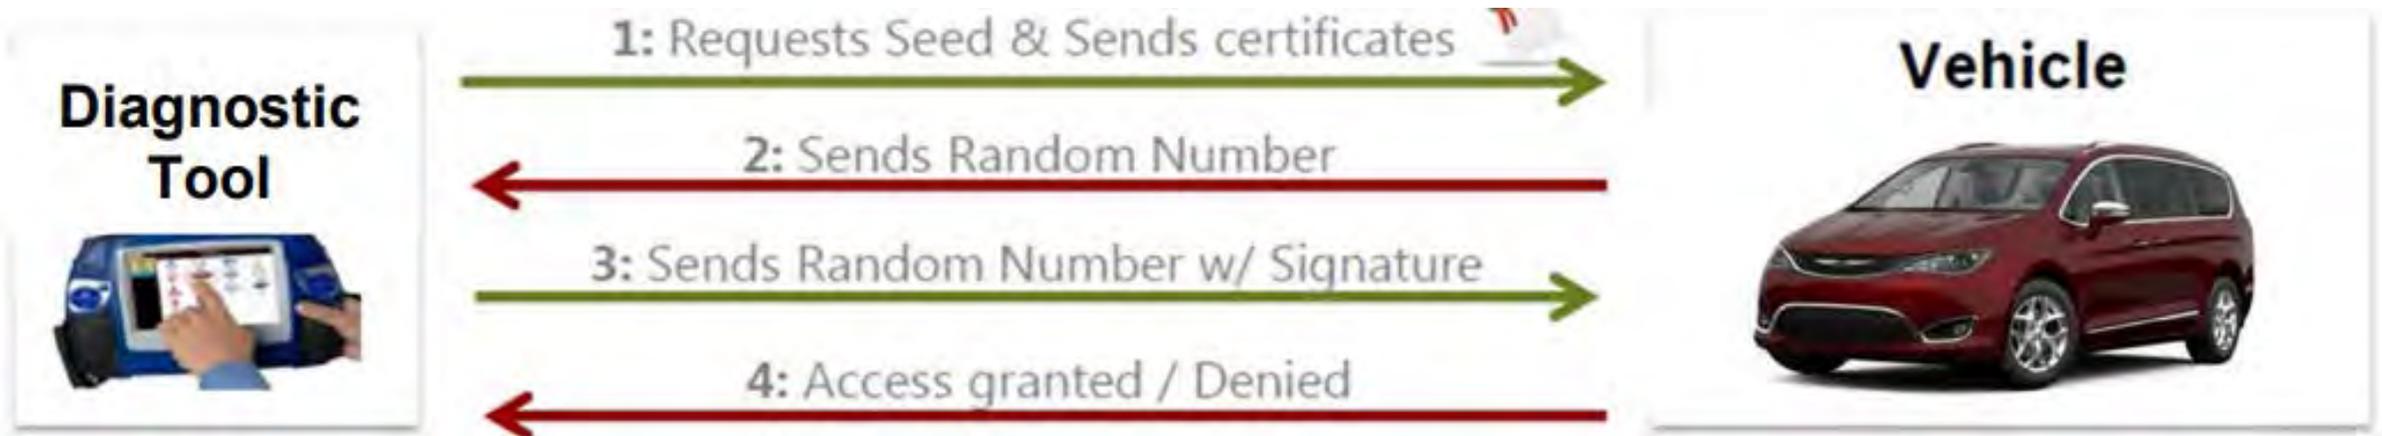

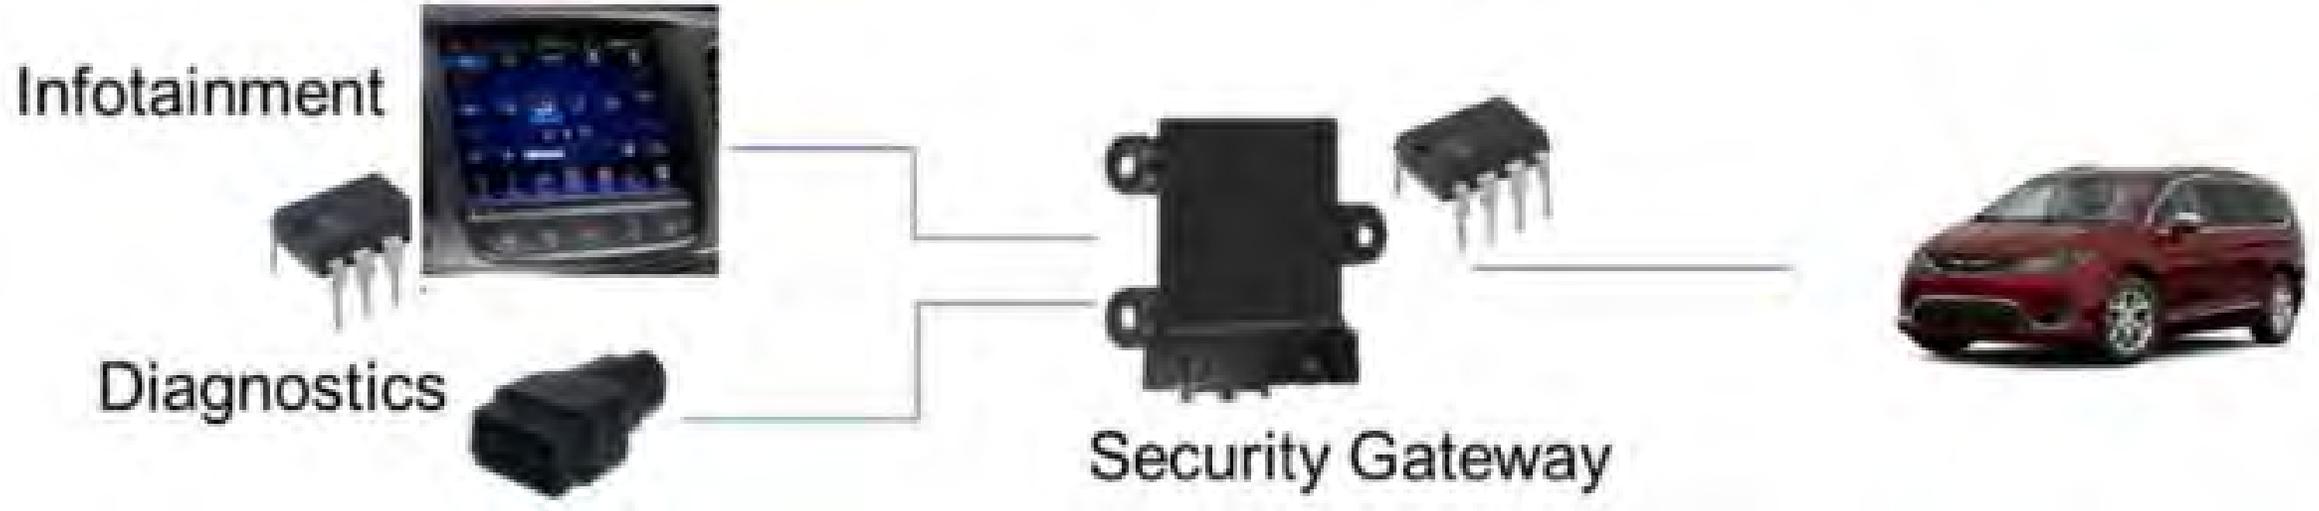

Physical Security

Digital Security

Physical Access is the weak point!

Gateways (Chrysler)

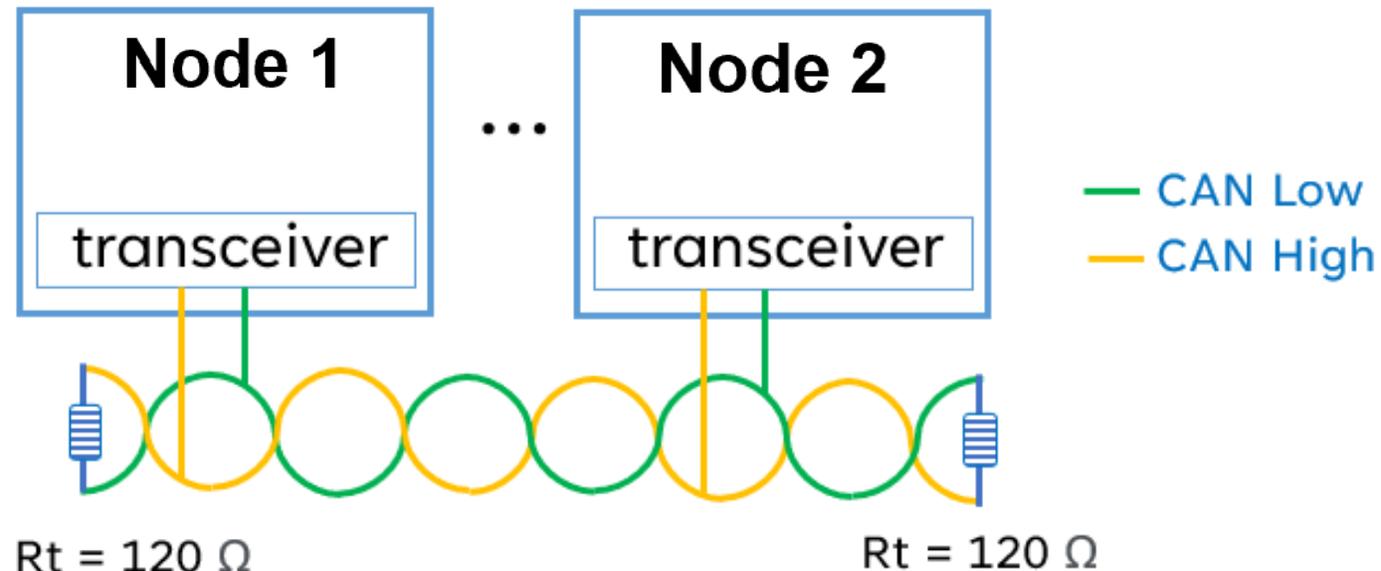

“This module functions as a secure firewall that protects external access to the vehicle via the radio and diagnostic connector from the rest of the vehicle network.”

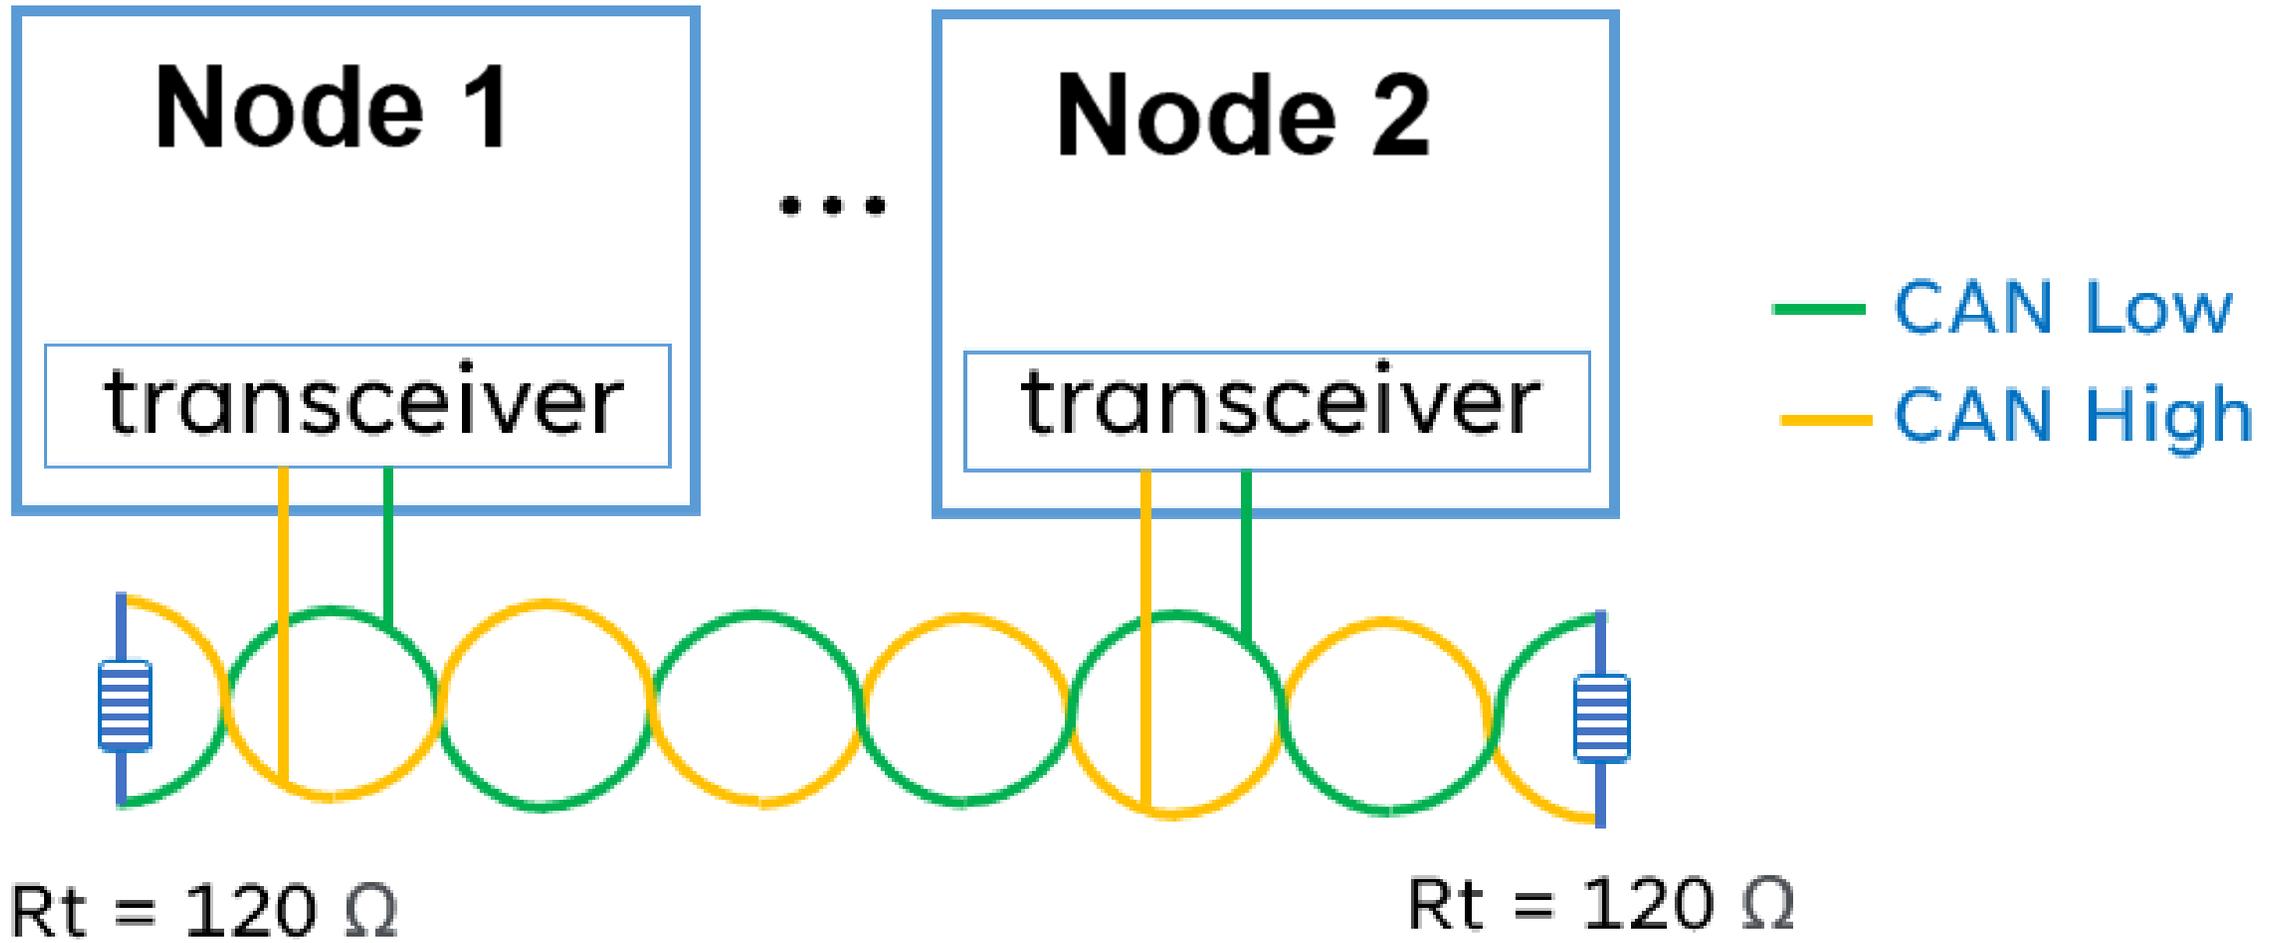

CAN Type Networks!

CAN:

A Controller Area Network (CAN bus) is a message-based protocol. For each device the data in a packet is transmitted sequentially but in such a way that if more than one device transmits at the same time the highest priority device can continue while the others back off. Packets are received by all devices, including by the transmitting device.

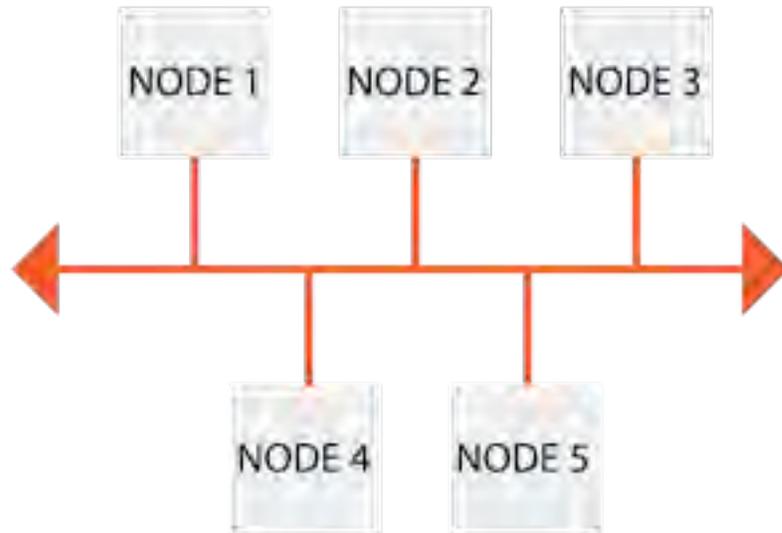

CAN Design

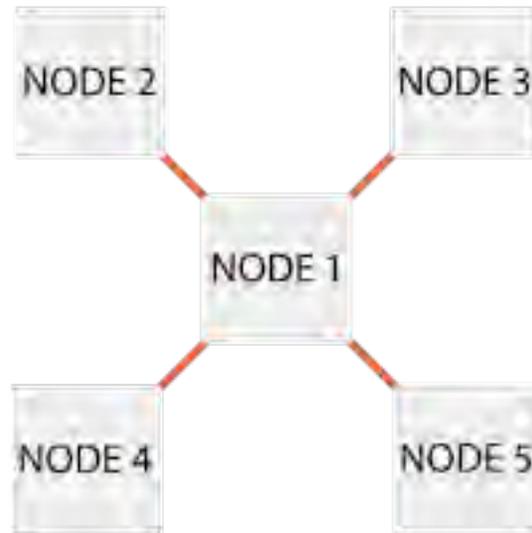

Common CAN Network Architectures

Multi-drop

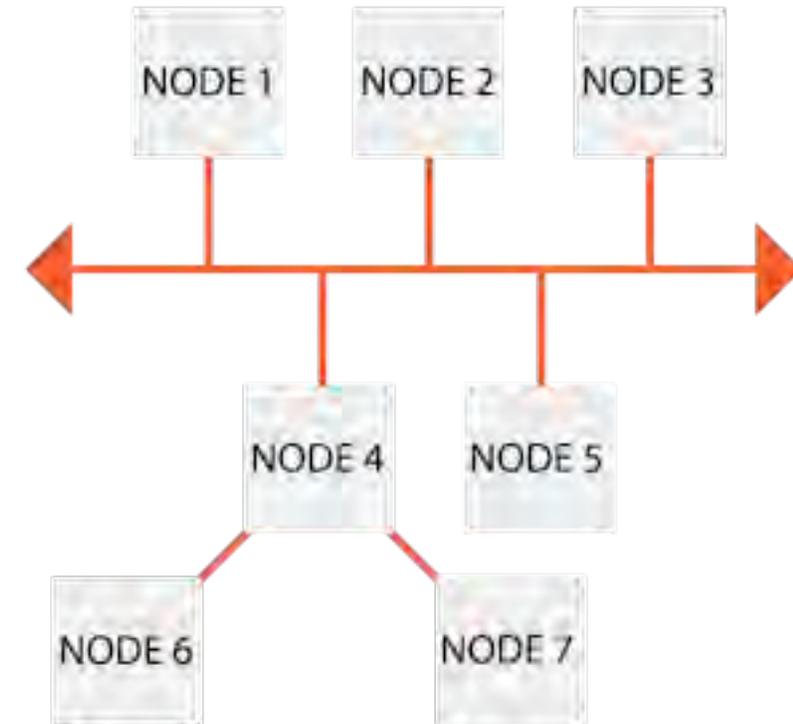

Network topologies

Star

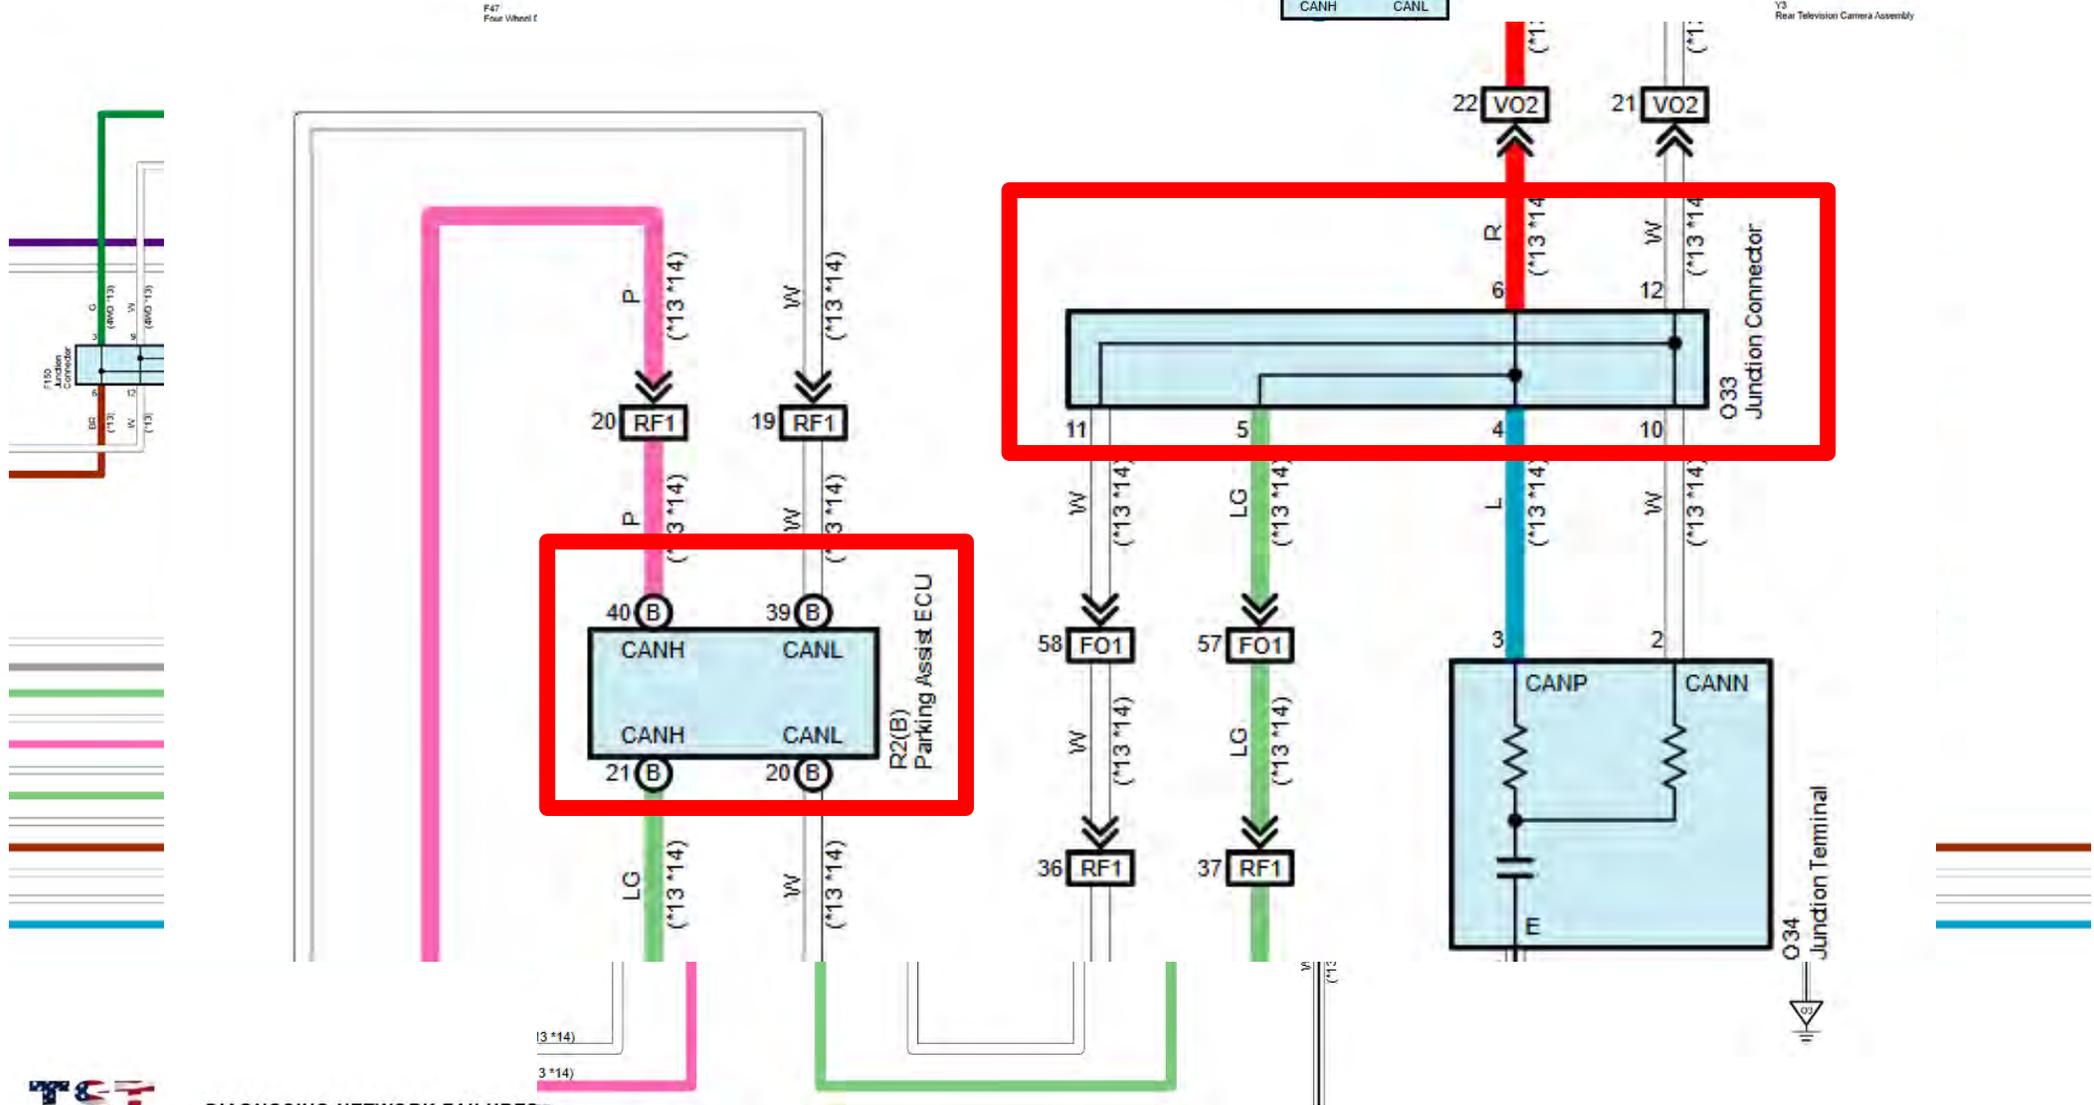

Mixed

Mixed CAN Network Architectures (Toyota)

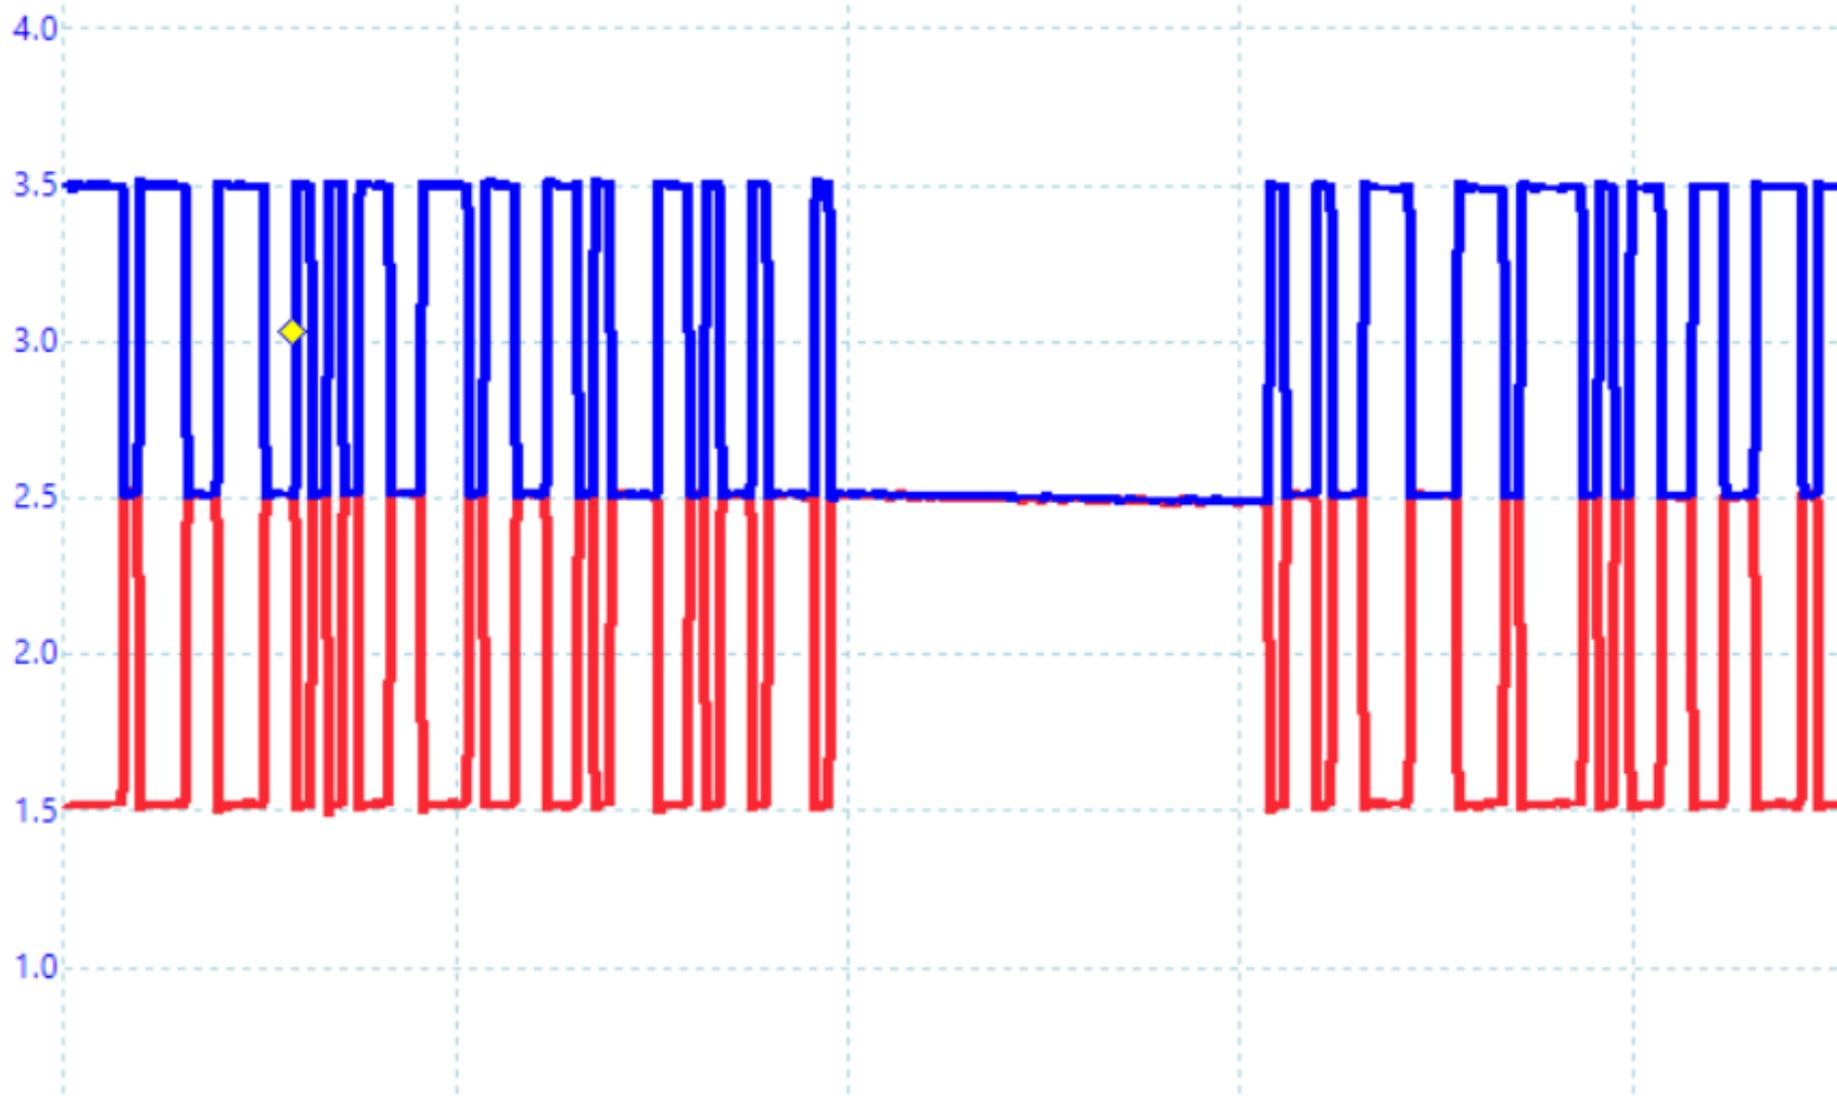

[+] System Circuit Power Source / Network

CAN Bus Architecture Premises

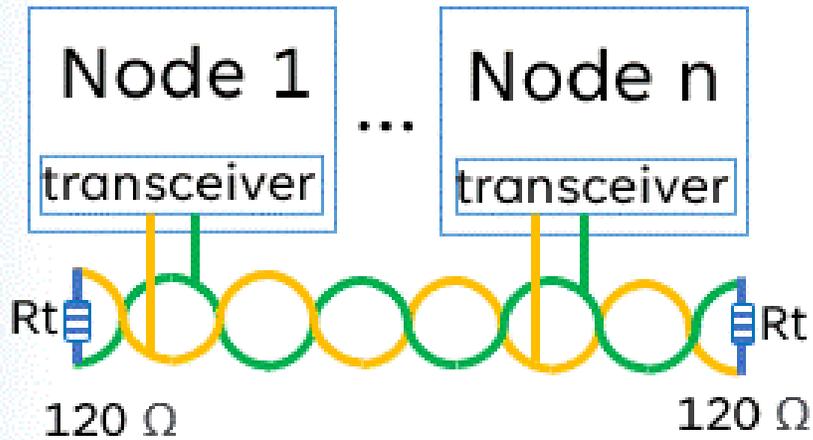

- **Decentralized/peer-to-peer topology:** All ECUs (Electronic Control Units) on the CAN bus are equal — there is no master.
- **Every node can transmit:** Any module (ECU) can initiate communication if the bus is idle.
- **Message-based arbitration:** Priority is determined by message ID, not by module hierarchy.

What is transferred over the wire(s)?

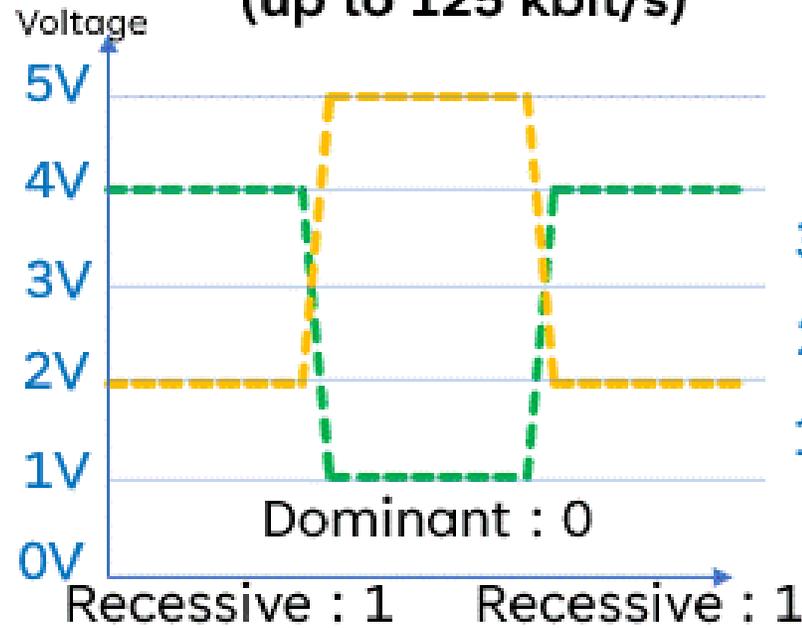

FIRST! How is a message created?

1 : CAN Bus Topology

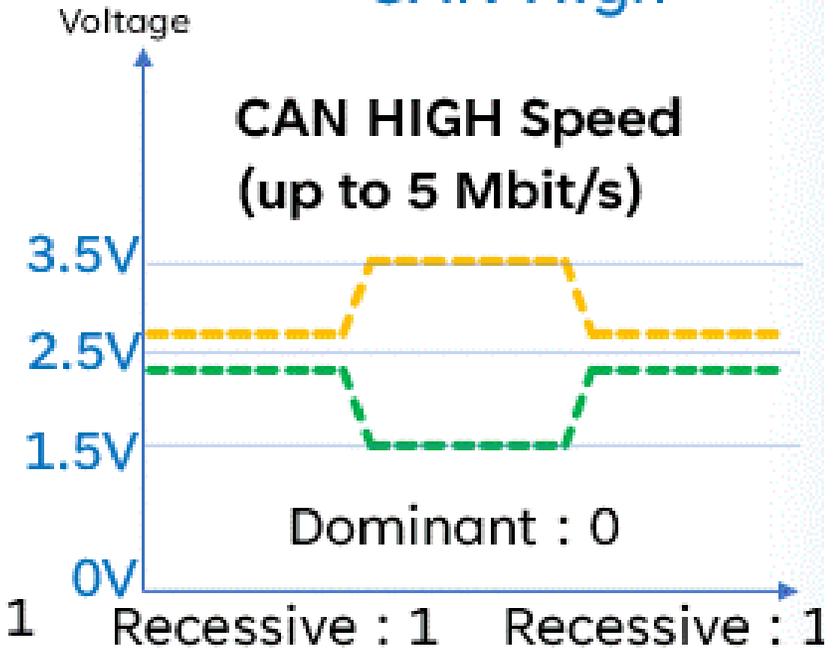

CAN LOW Speed
(up to 125 kbit/s)

— CAN Low
— CAN High

CAN HIGH Speed
(up to 5 Mbit/s)

What is in a Message?

2 : Frame

	SOF	Arbitration	Control	Data	CRC	ACK	EOF
In bits	1	12 or 32	6	0 to 64	16	2	7

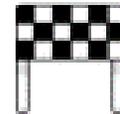

Start Of Frame
Always a 0

Control : Includes
DLC (Data Length
Code)

CRC : Error (Data
corruption) detection

End Of Frame

Who Gets to Talk?

3 : Arbitration

Node 15

Node 16

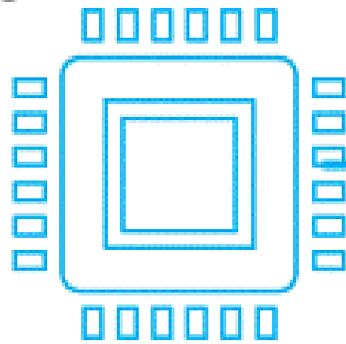

The node with the **lowest ID** has the **highest priority**

Start	ID BITS						
Bit	10	9	8	7	6	5	4
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0

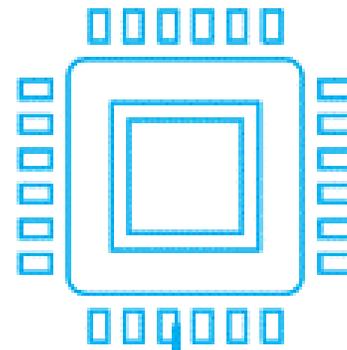

Who can Hear it?

4 : Msg filtering

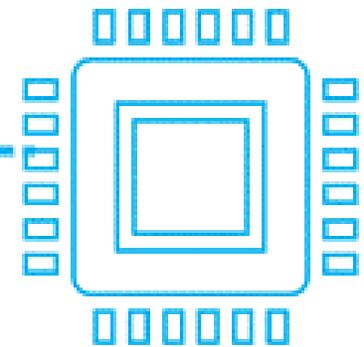

accepts data with ID
in range : **0x310 – 0x350**

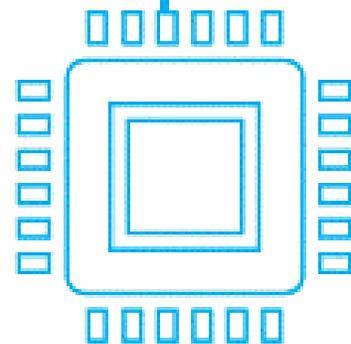

accepts data with ID
in range : **0x50 – 0x150**

accepts data with ID
in range : **0x150 – 0x200**

accepts data with ID
in range : **0x100 – 0x1FF**

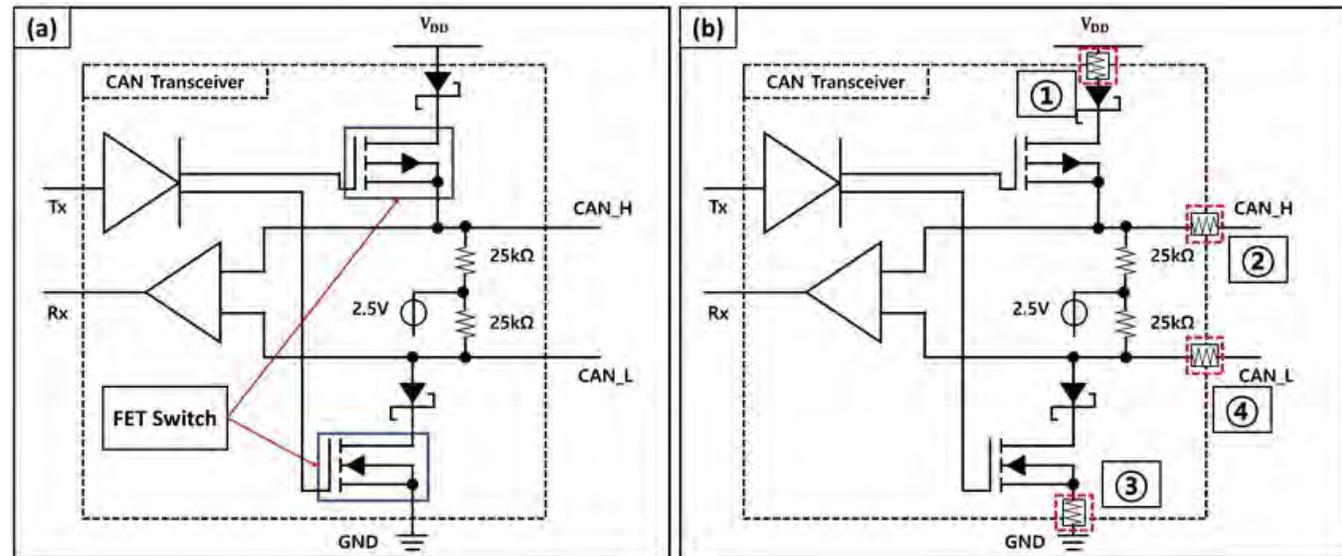

What Makes that Message Happen?

A **CAN transceiver** is the physical interface between:

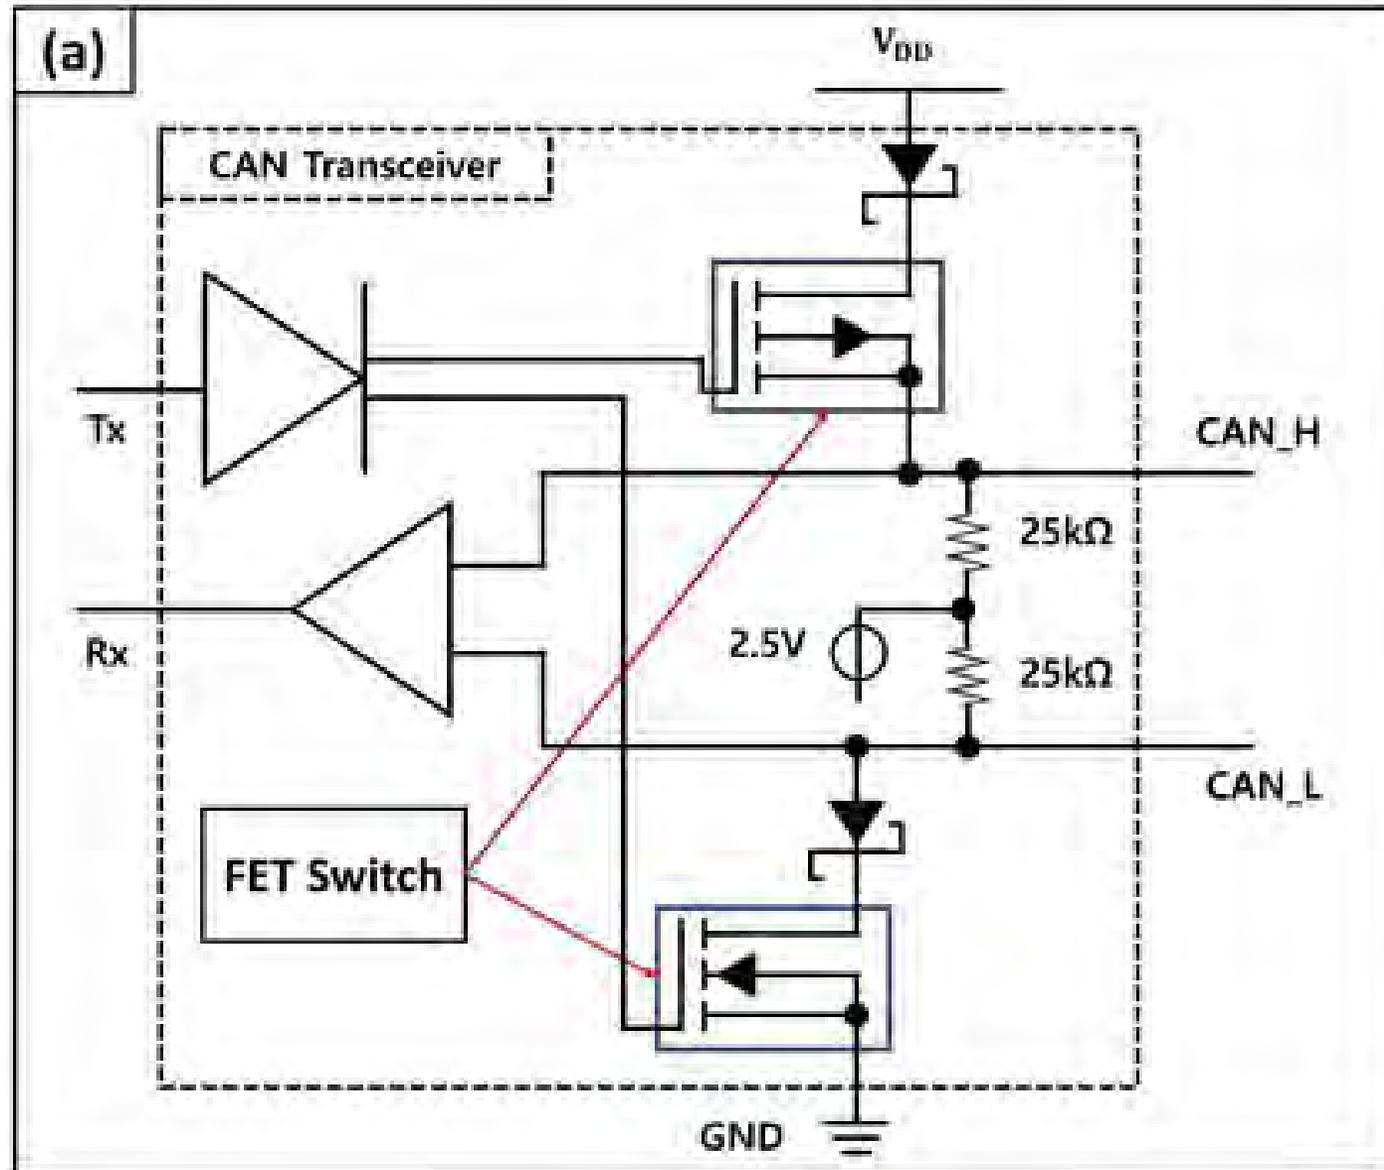

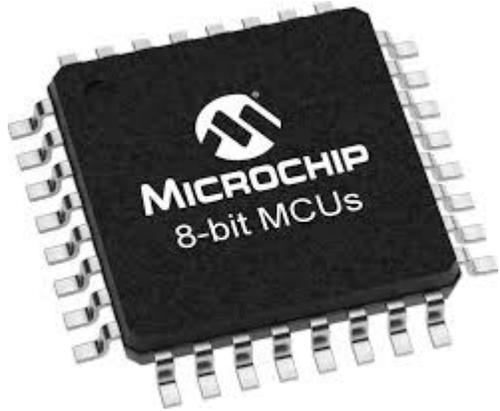

- The **CAN controller** (inside an MCU or external chip)
- The **physical bus wires** (CAN_H and CAN_L)

It doesn't create the *message content* — it **drives the electrical signal** that physically places bits on the bus.

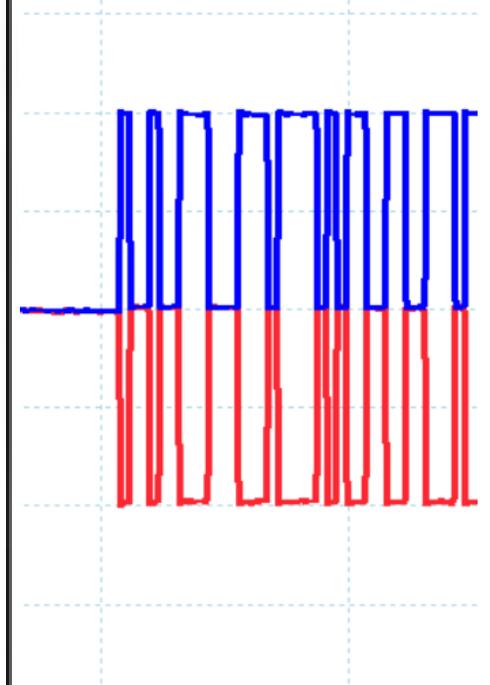

What Makes that Message Happen?

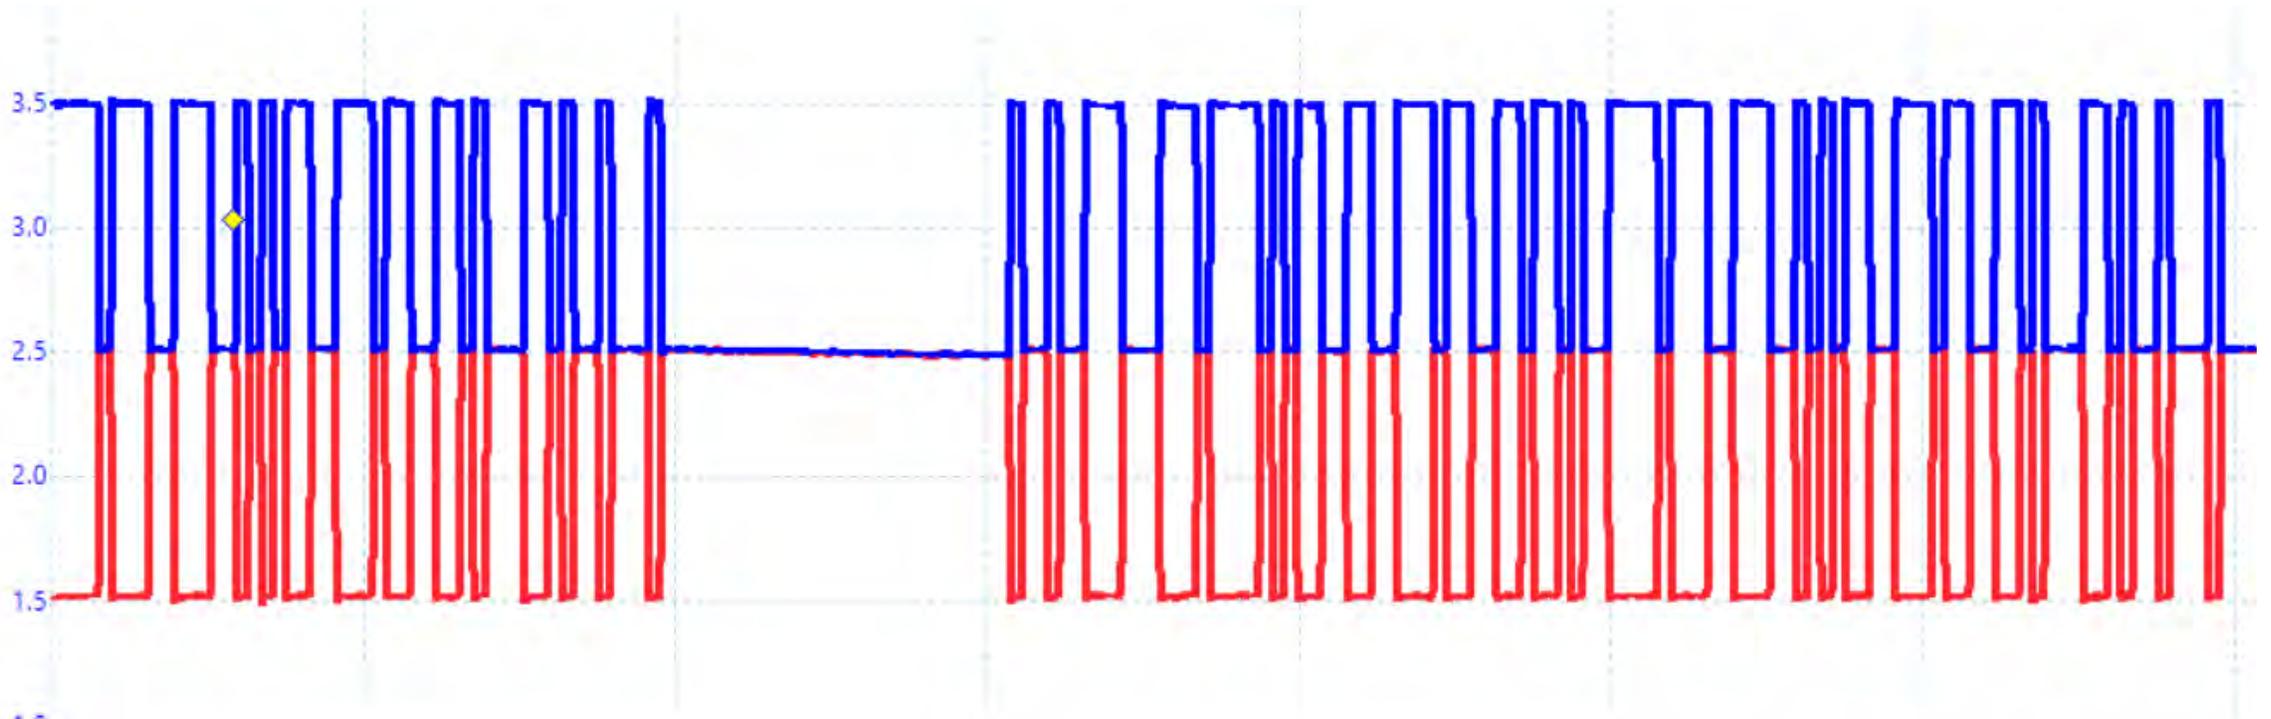

Input Data

Output Data

What is a transferred?

CANFD Bus (Flexible Data Rate)

CAN FD is an advanced automotive network protocol that allows higher data output and larger messages than standard CAN, using the same physical wiring but with updated controllers and software. It enables modern vehicle functions like high-speed diagnostics, OTA updates, and ADAS coordination.

Backward-Compatible - CAN FD controllers can still handle standard CAN traffic.

Section	Classical CAN	CAN FD (ISO)
Data Length	0 to 8 bytes	0 to 64 bytes
Control Field	DLC only	DLC + EDL + BRS + FDF + reserved bits
CRC Field	15-bit	17-bit (0–16 bytes) / 21-bit (17–64 bytes)
Bit Rate	Fixed (1 Mbps max)	Arbitration phase fixed, data phase can be faster (up to 8 Mbps)
New Bits		 EDL (Extended Data Length), BRS (Bit Rate Switch), ESI (Error State Indicator)

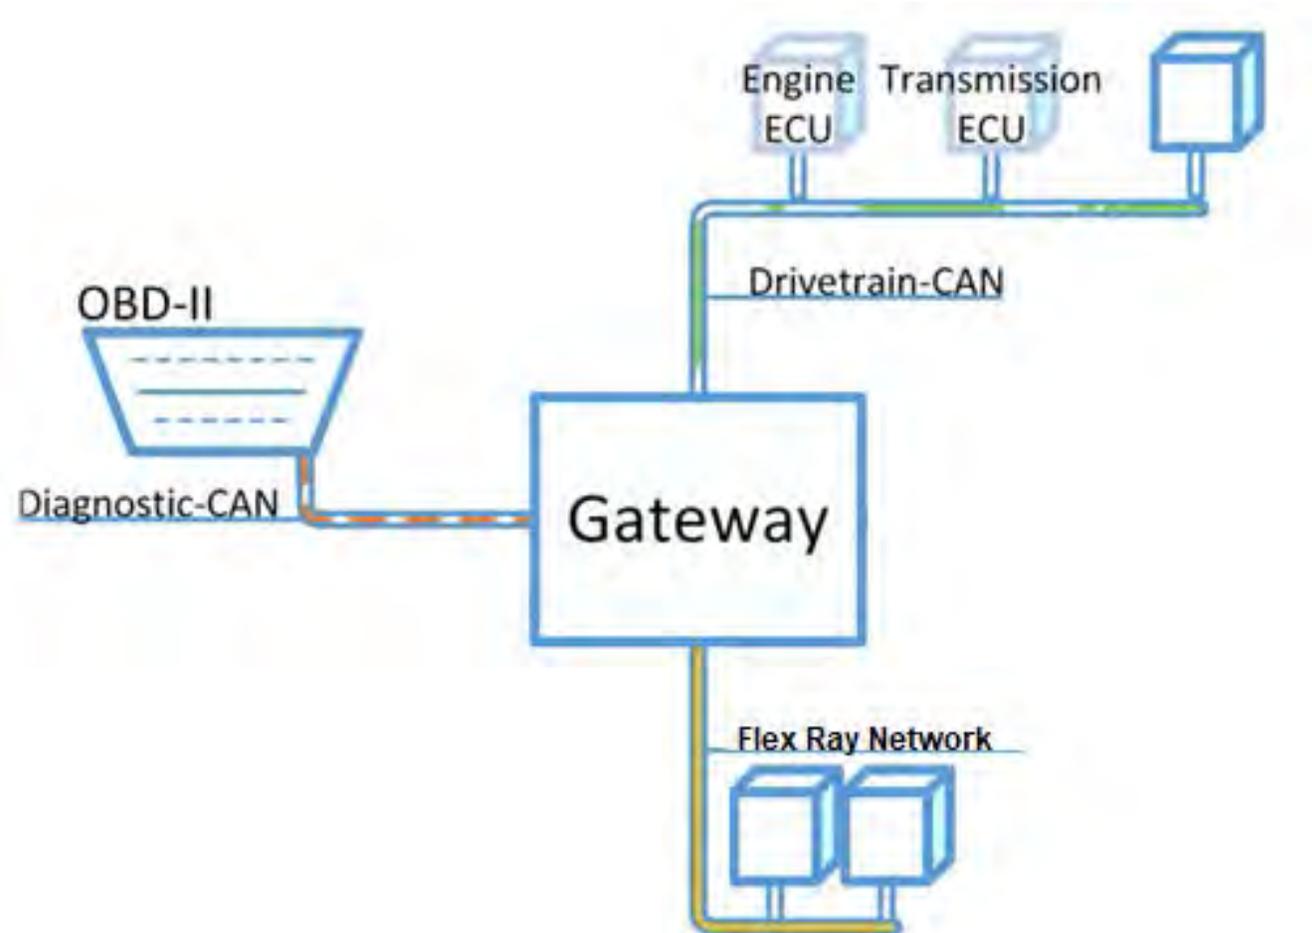

Flex Ray Bus

FlexRay is a deterministic, high-speed, fault-tolerant automotive network protocol, designed for real-time systems like: Brake-by-wire, Steer-by-wire, Redundant safety-critical systems & others.

Feature	CAN / CAN FD	FlexRay
Bitrate	1 Mbps / 8 Mbps max	10 Mbps per channel
Determinism	No (priority-based)	Yes (time slots)
Payload Size	8 B / 64 B	Up to 254 B
Topology	Bus only	Bus, Star, or Hybrid
Channels	Single	Dual (redundant or dual-load)
Fault Tolerance	Limited	Built-in redundancy
Timing	Event-based (arbitration)	Time-triggered (preallocated)

Flex Ray Bus Specifics

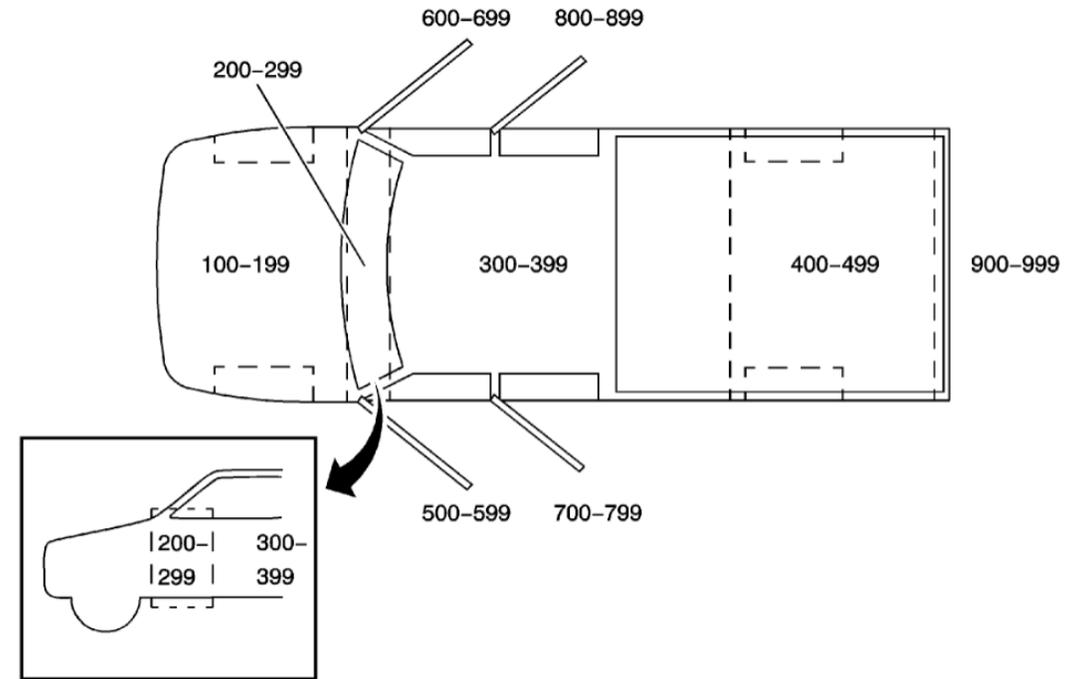

Flex Ray will have no connection to the DLC!

2 Wire CAN Bus Speeds

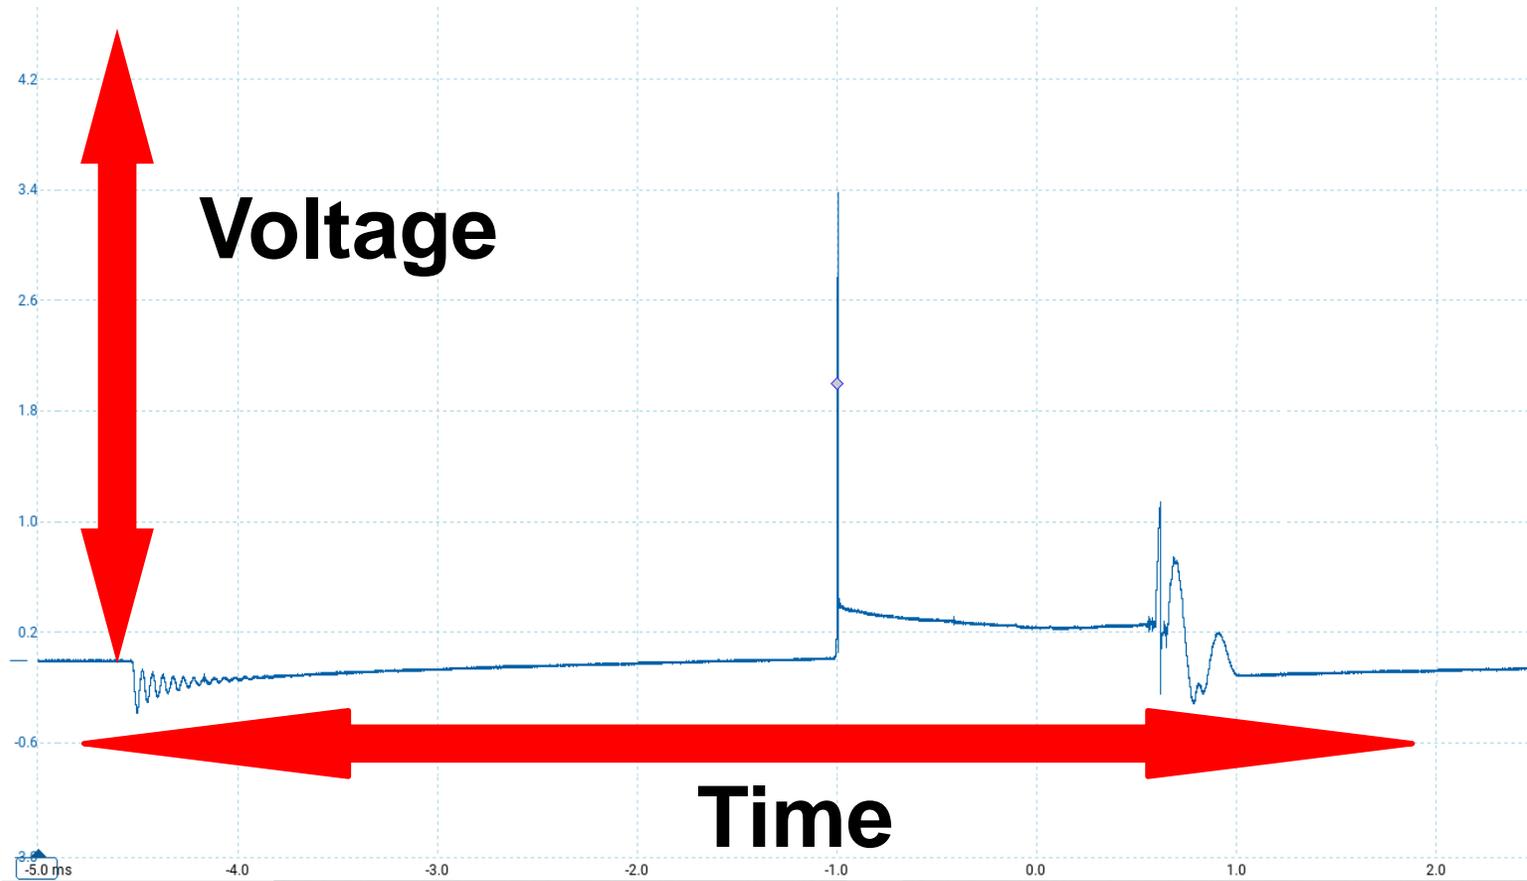

Feature	Classical CAN	CAN FD	FlexRay
Common Bitrate in Practice	125–500 kbps	500 kbps arb / 2–5 Mbps data	10 Mbps per channel
Typical Payload Size	8 bytes max	64 bytes max	254 bytes max
Used For	Powertrain, body, diagnostics	OTA updates, ADAS, gateways	X-by-wire, chassis coordination
Max Nodes (practical)	~30 nodes	~30 nodes	~64 slots per cycle (time slots)
ECU Examples	PCM, BCM, ABS, SRS	Gateway, TCU, ADAS, Flash updates	Steer-by-wire, Dynamic Chassis, Brake control
Scan Tool Compatibility	 Universal	 Requires FD-capable tool	 Proprietary / very limited

What Tools Do We Need?

Diagnostic Tools

Oscilloscopes

- AC coupling
- Variable sample rates
- DSO over “live only”
- Refresh rate is superior
- Documentation

Diagnostic Tools

Oscilloscopes

Run and Gun Scopes!

- Usually lower cost
- Typically, low channel count
- Very few “DS” options
- Limited waveform manipulations

Diagnostic Tools

DLC Breakout Box

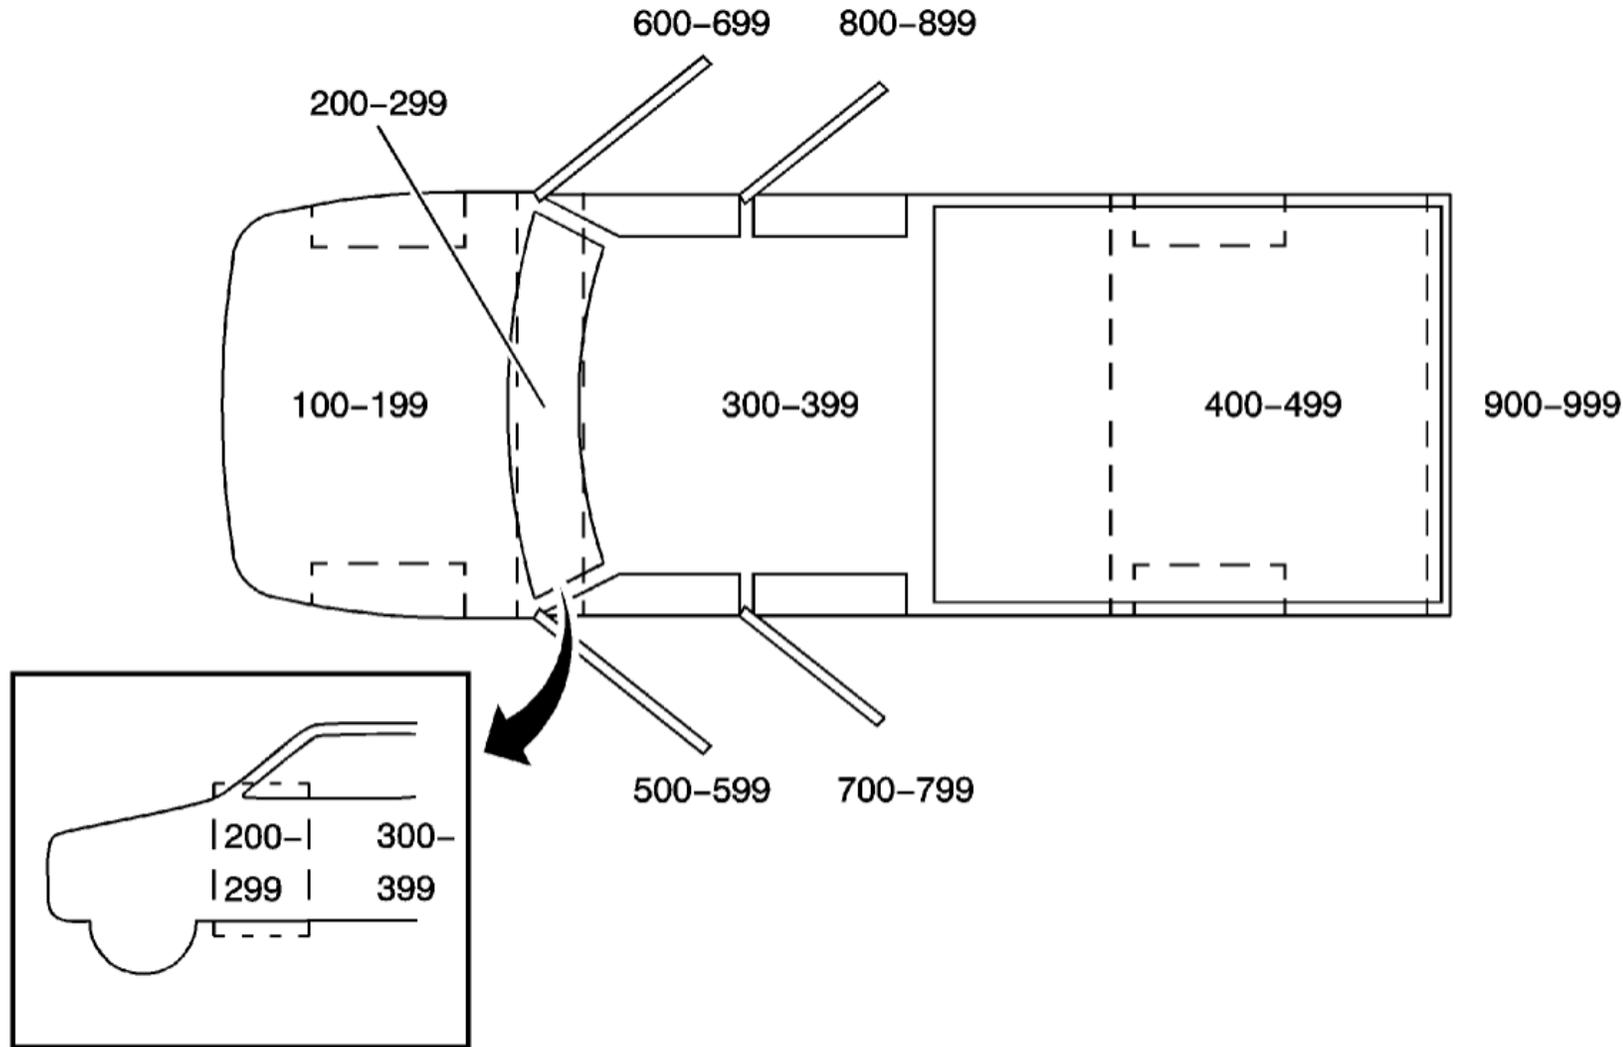

Diagnostic Tools

Having the correct tool for the job is only half of the battle, It's significantly more important to understand the features and limitations of the tool you own.

“The best scope in the world is the one you have”

Wiring Diagrams

Vehicle Zoning:

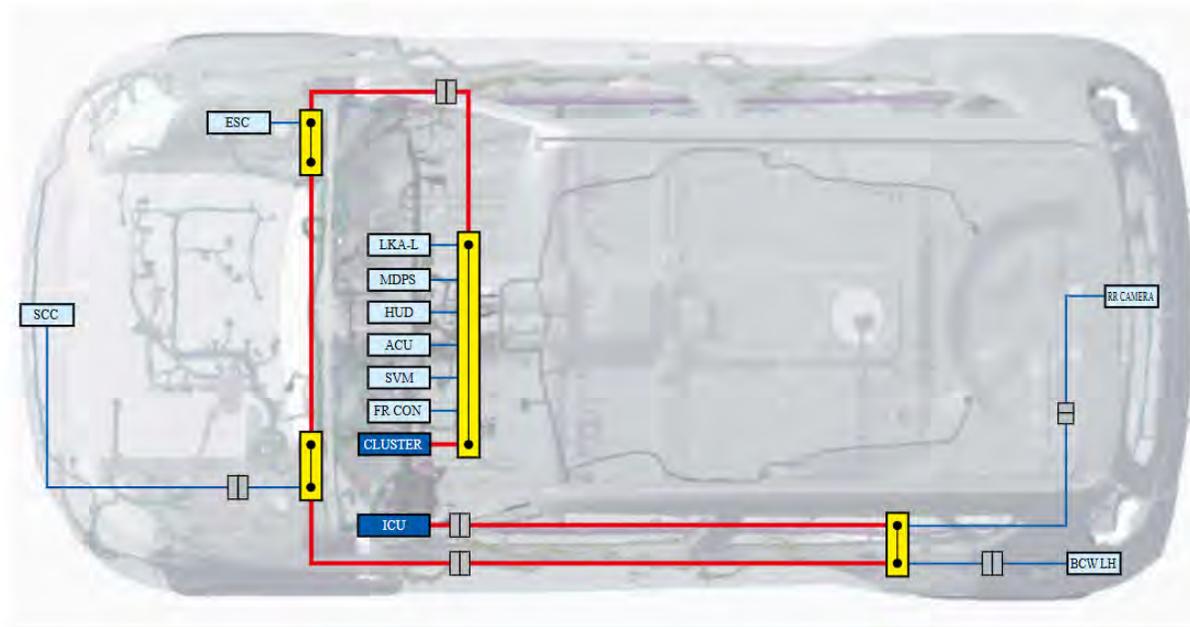

Wiring diagrams, junction connectors, splices and other things use this zoning strategy.

Confirmation

Remember not all tools are created equal!

Have multiple scan tools, OE are the best for each individual situation.

Know your tool and know its limitations as not all tools can communicate with all modules on all makes and models.

Examples?

Dealer Level Scan Tool Capabilities

NTB10-066a

CAN COMMUNICATION CODES – DIAGNOSTIC TIPS & GUIDELINES

- Red = Current Communication Error
- Orange = Past or Intermittent Communication Error
- Black = Not diagnosed
- Green = Normal Operation
- Pink = Module error

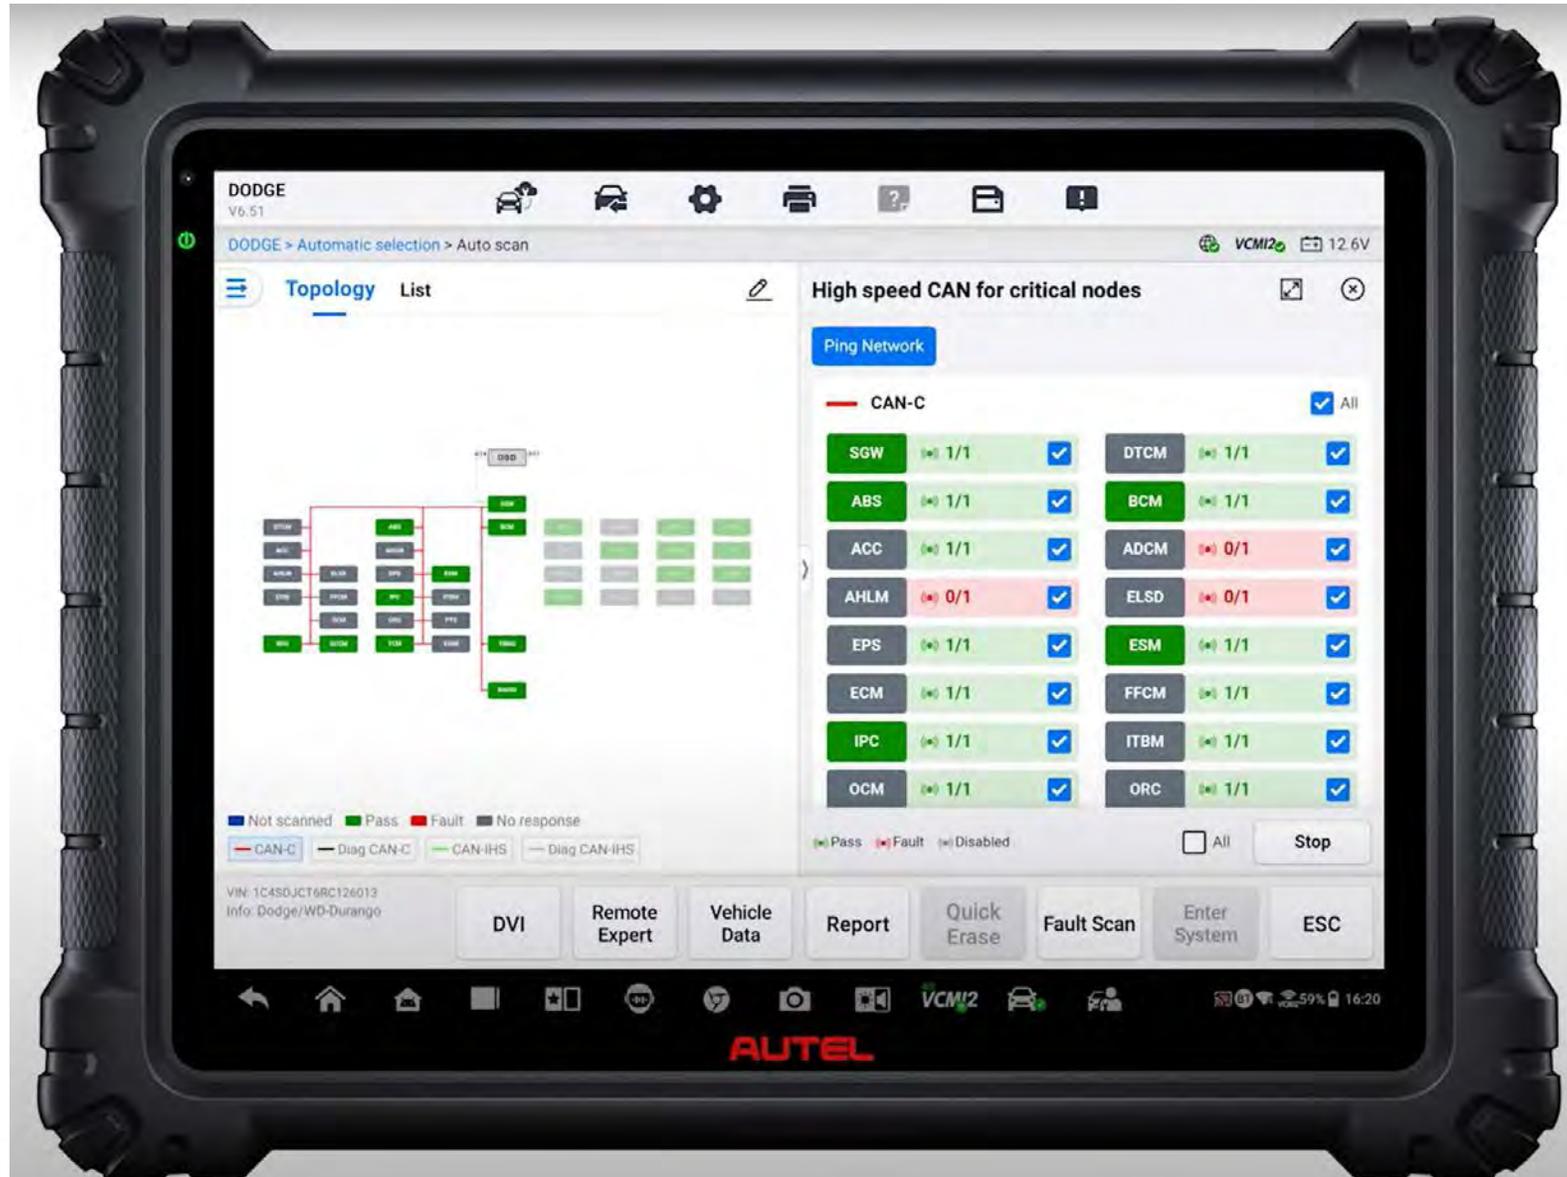

Note: If module is highlighted in pink when other modules or segments are highlighted in red or orange, perform diagnosis on other modules, erase DTCs, and run Auto CAN diagnosis with CONSULT-III again. If module is still highlighted in pink, replace module.

Dealer Level Scan Tool Capabilities

The screenshot displays a 'Network Monitor' simulation window. At the top, there are control buttons: 'Stop' (red), 'Reset' (blue), 'Enable All' (green), and 'Beep Disabled' (orange). The status 'Checking response from' is shown on the right. Below are four vehicle sections, each with a 'Network Enabled' dropdown and a grid of component status cards. Each card shows a component name, a status indicator (1 in red or 0 in white), and an 'Enabled' button.

120 Ω Resistors

Initial Analysis

Baseline Resistance Test:

Location	Short to B+	Short to B-	High Resistance	No Issues
Pins 6 & 14	60Ω (+/- 10Ω)	60Ω (+/- 10Ω)	0 or 120Ω	60Ω (+/- 10Ω)
Pin 14 to B+	< 2Ω	5-80Ω	Open	Open
Pin 14 to B-	5-80Ω	60Ω (+/- 10Ω)	Open	Open
Pin 6 to B+	60Ω (+/- 10Ω)	5-80Ω	Open	Open
Pin 6 to B-	5-80Ω	< 2Ω	Open	Open

Is it a short? Or...

Possible Cause

- IPM, SCM are not Sleep condition
 1. CAN High Line short to battery
 2. CAN Low Line short to battery
 3. CAN High Line short to ground
 4. CAN Low Line short to ground
 5. CAN High and Low line short to each other
 6. CAN High Line short to 5V power
 7. CAN High Line open
 8. CAN Low Line open

⚠ CAUTION

Under Sleep condition, CAN High Line is 0V and CAN Low Line is battery voltage.

Where do we go?

Build a Plan!

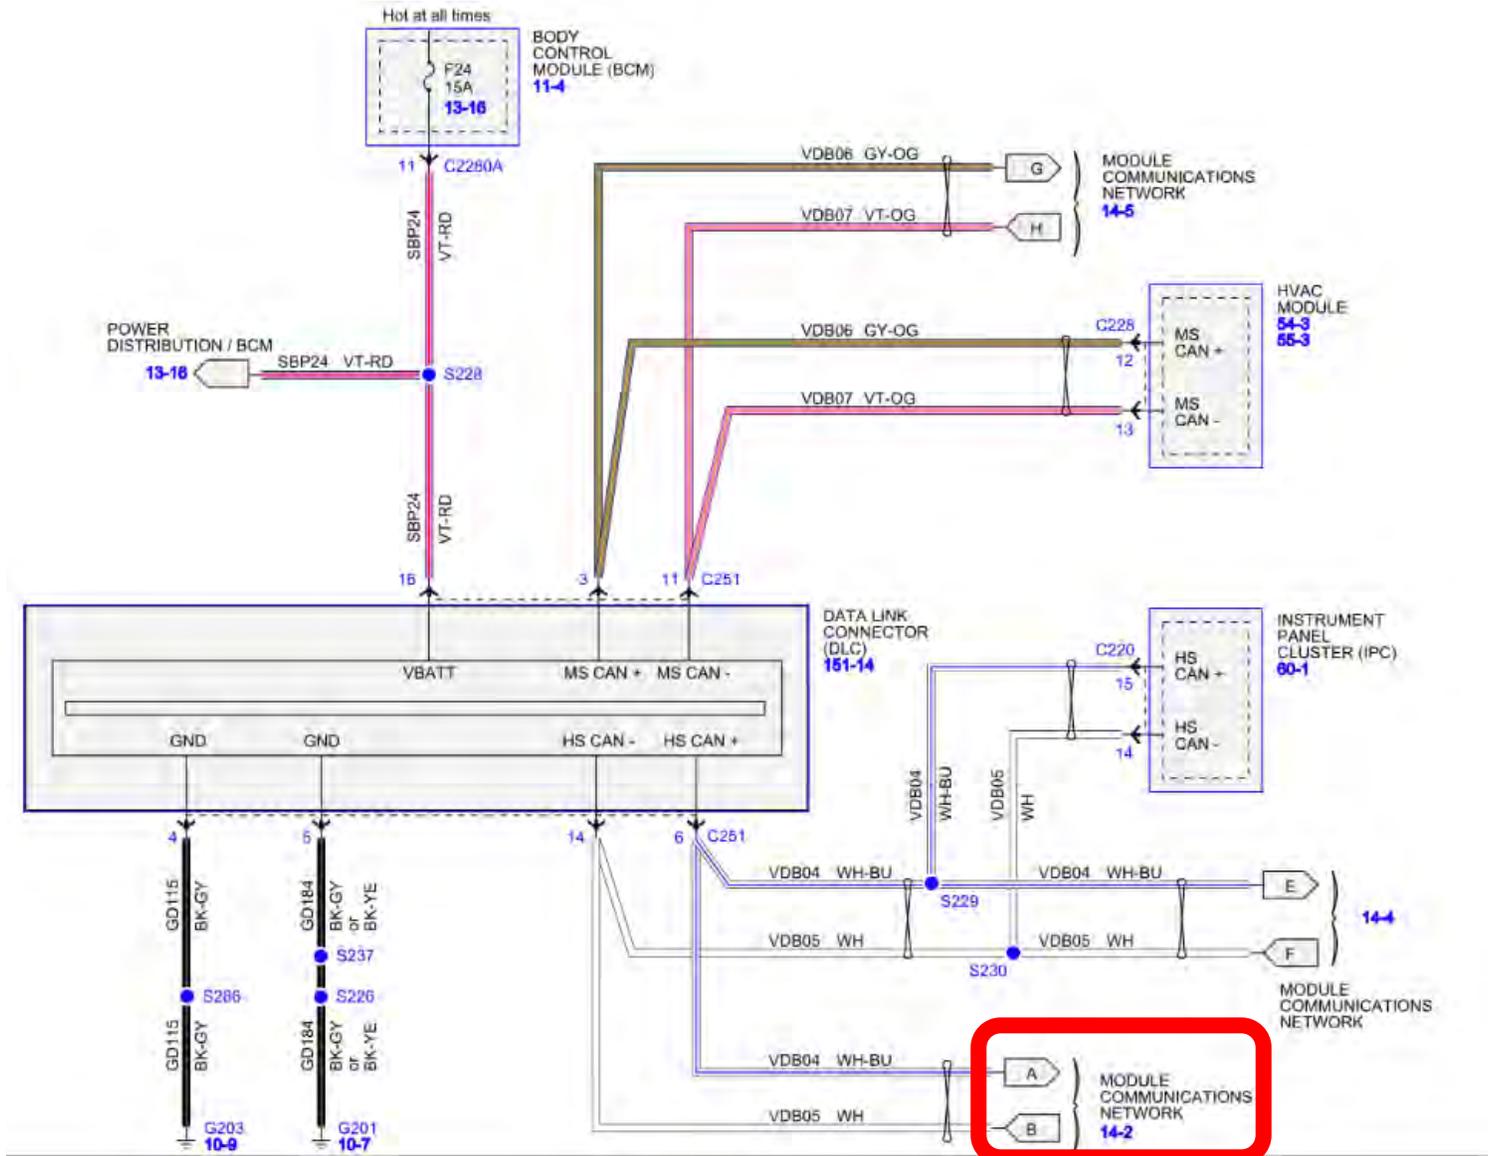

Remember Pins 6, 14 show 120 ohms resistance key out.

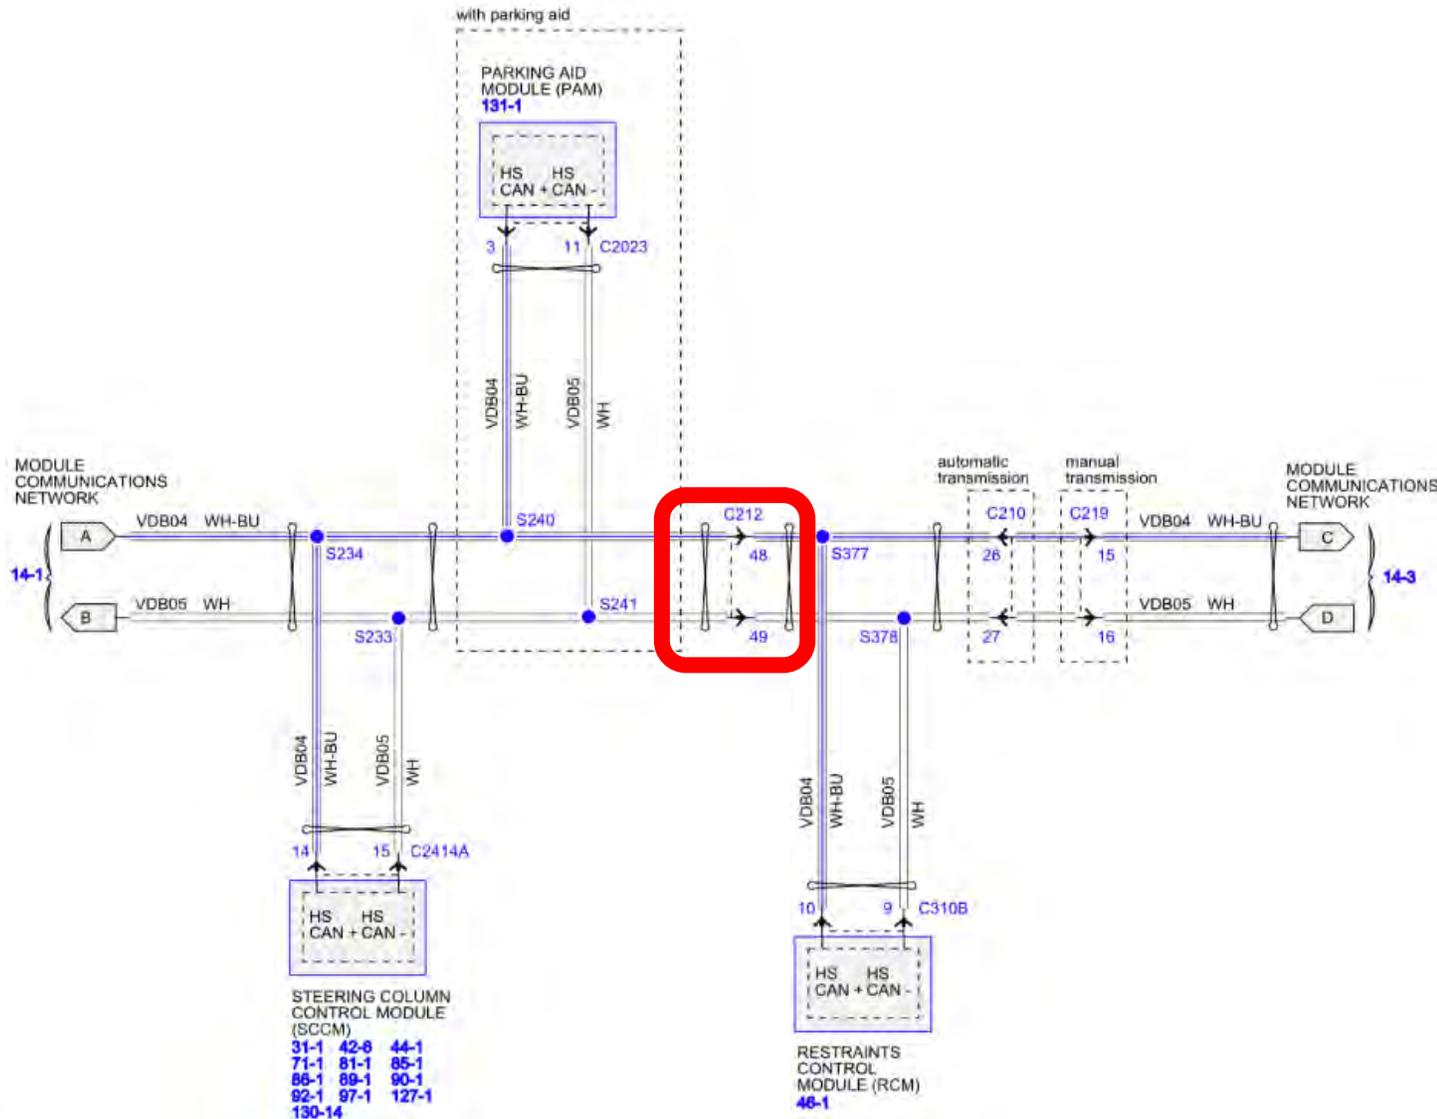

How we go forward is the same regardless of our resistance, but what we look for is what's important!

Build a Plan!

There are no “access” points that are easily accessible on this diagram, lets look forward and I’ll show you what we are looking for.

Build a Plan!

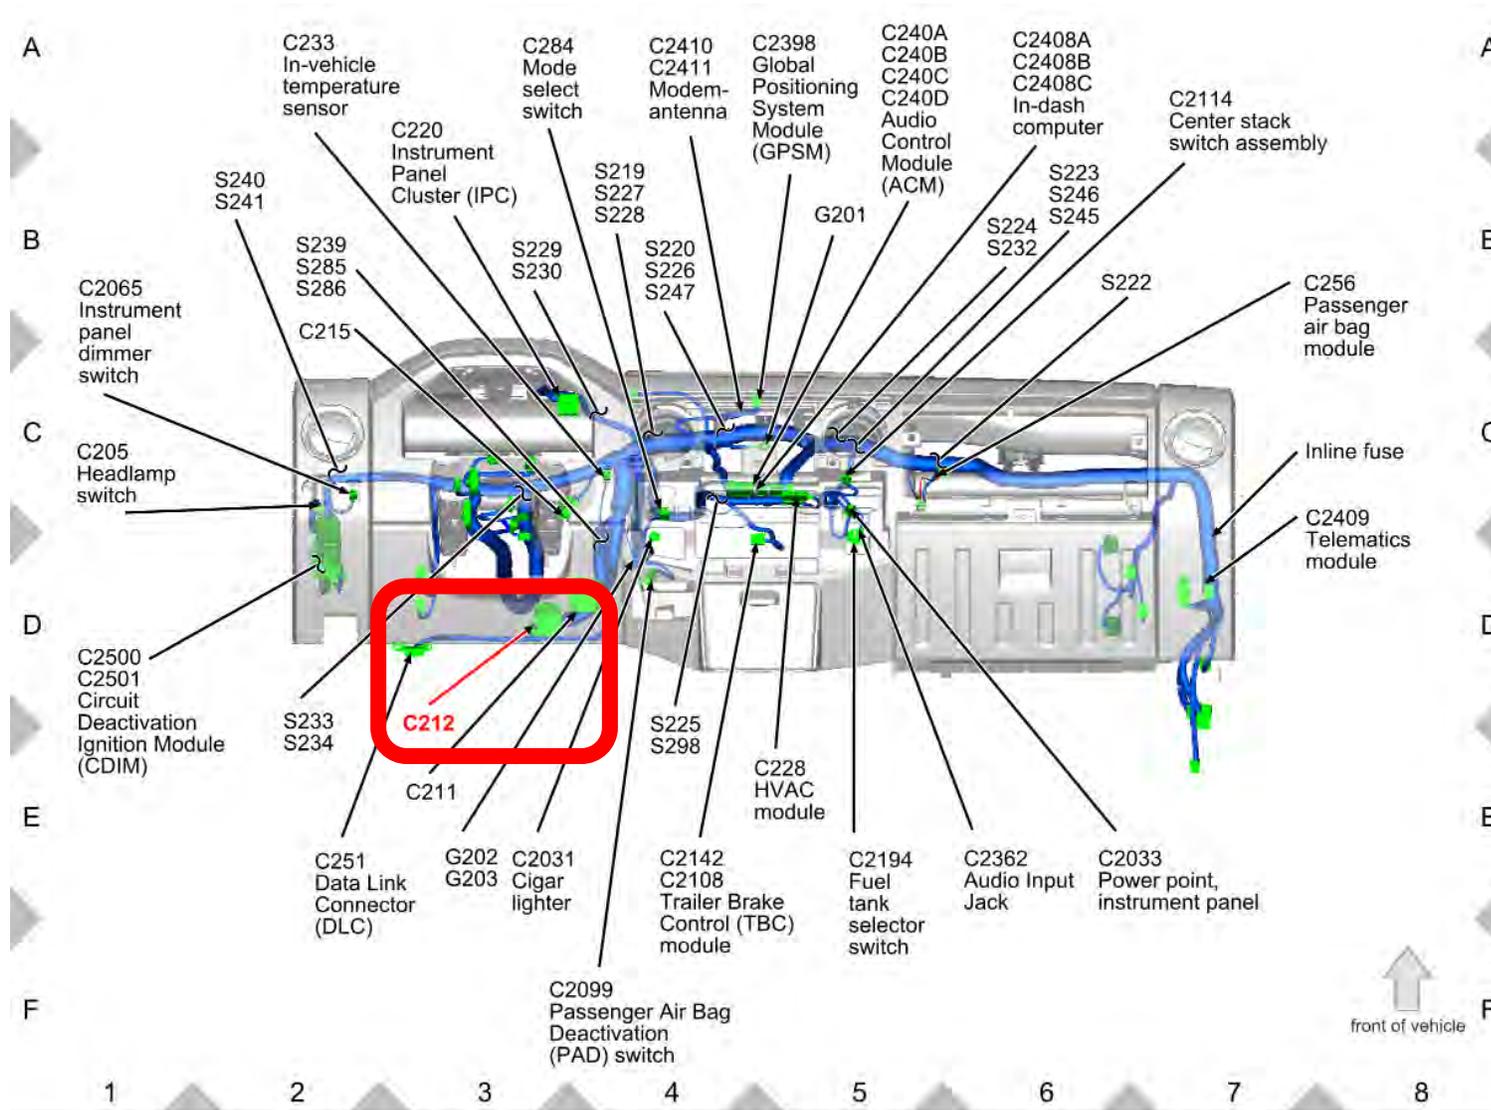

There are no “access” points that are easily accessible on this diagram, lets look forward and I’ll show you what we are looking for.

Connector C212 is our first access point... where is it?

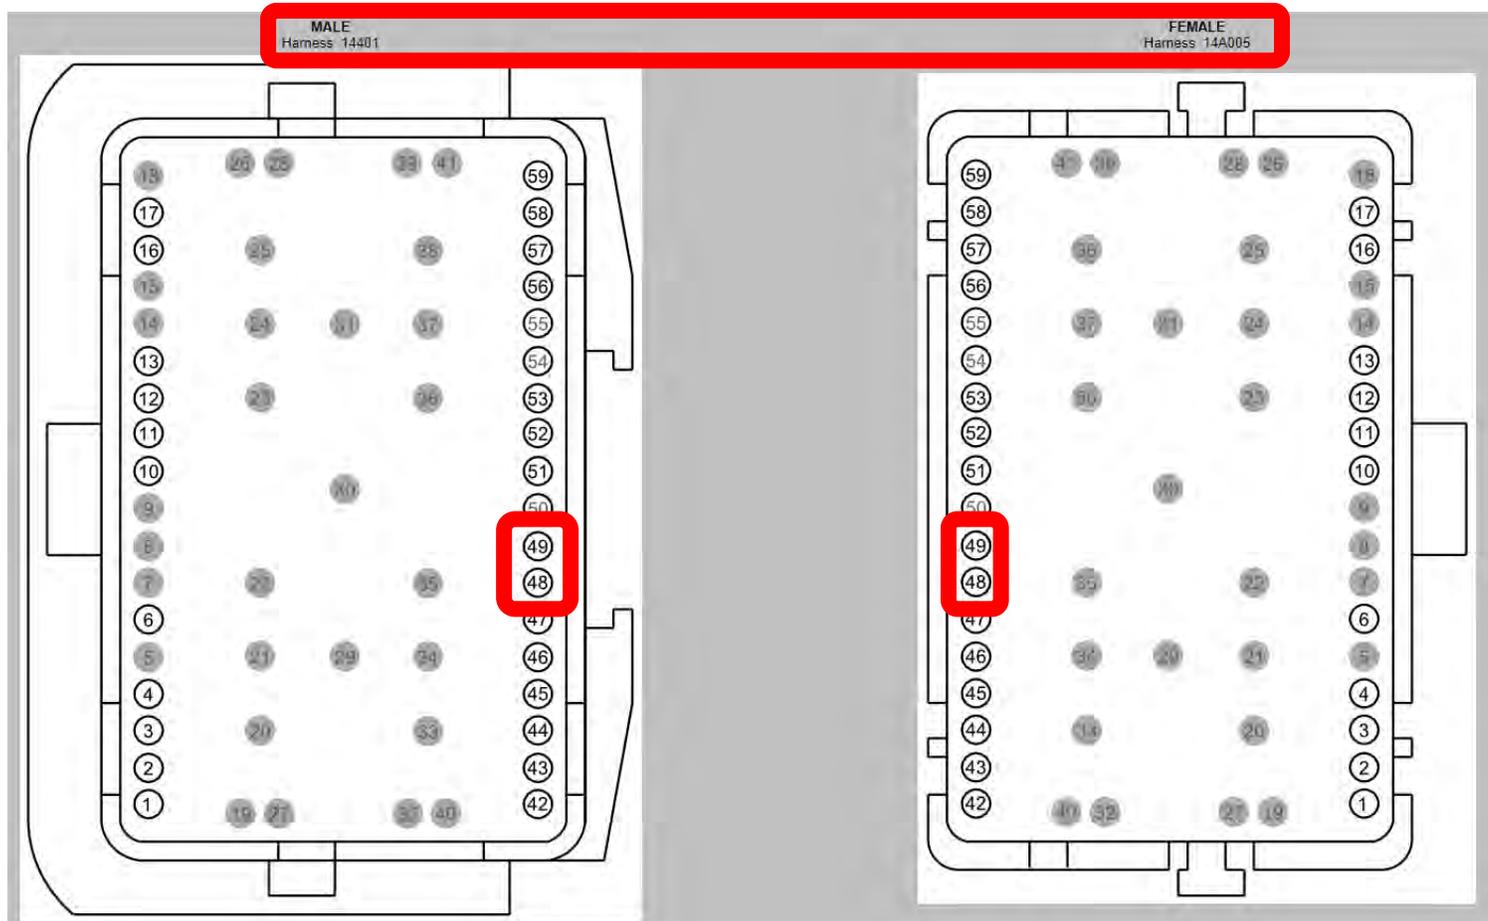

Build a Plan!

This looks easy to physically get to, what do we do with it?

Let's look closer.

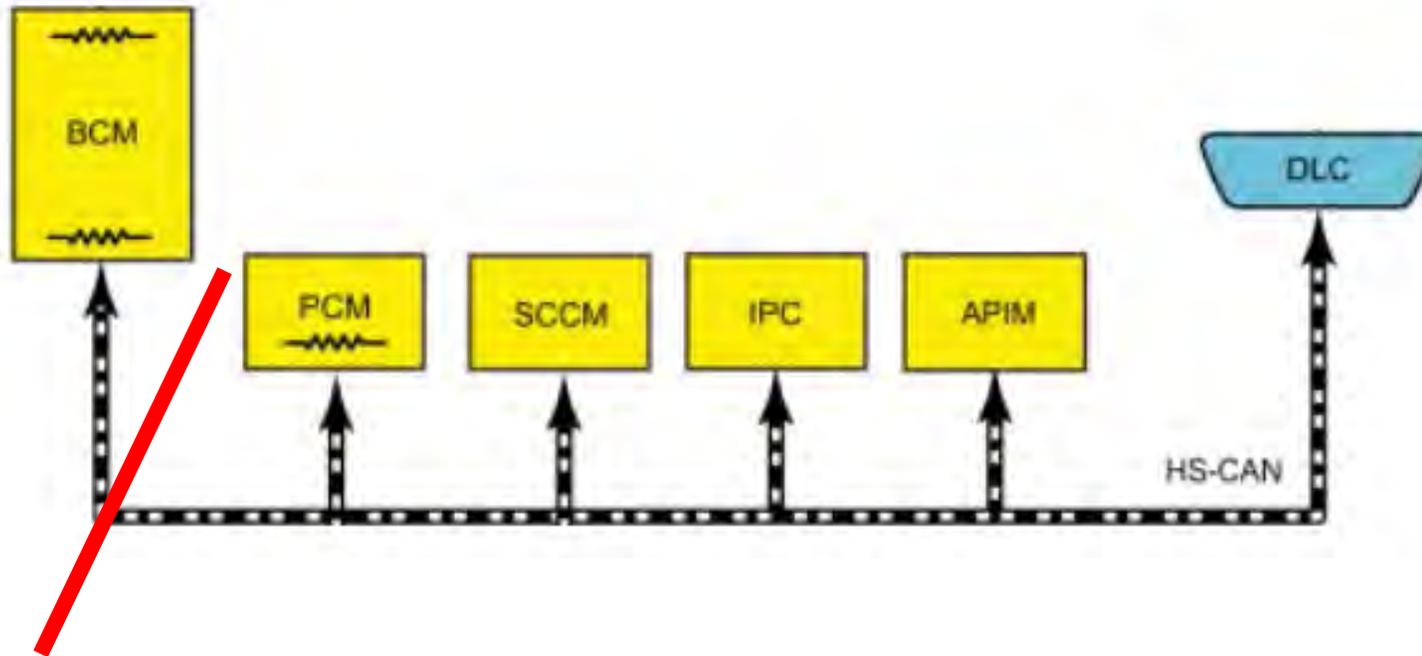

Build a Plan!

Looking at the pinout of the connector, we see our 2 network lines locations.

My personal test is to measure the resistance of the network on either side and see if we have 120 on either.

Build a Plan!

Essentially, a careful inspection of the location of the connector reveals, we have separated the terminating resistors on either side of the connector.

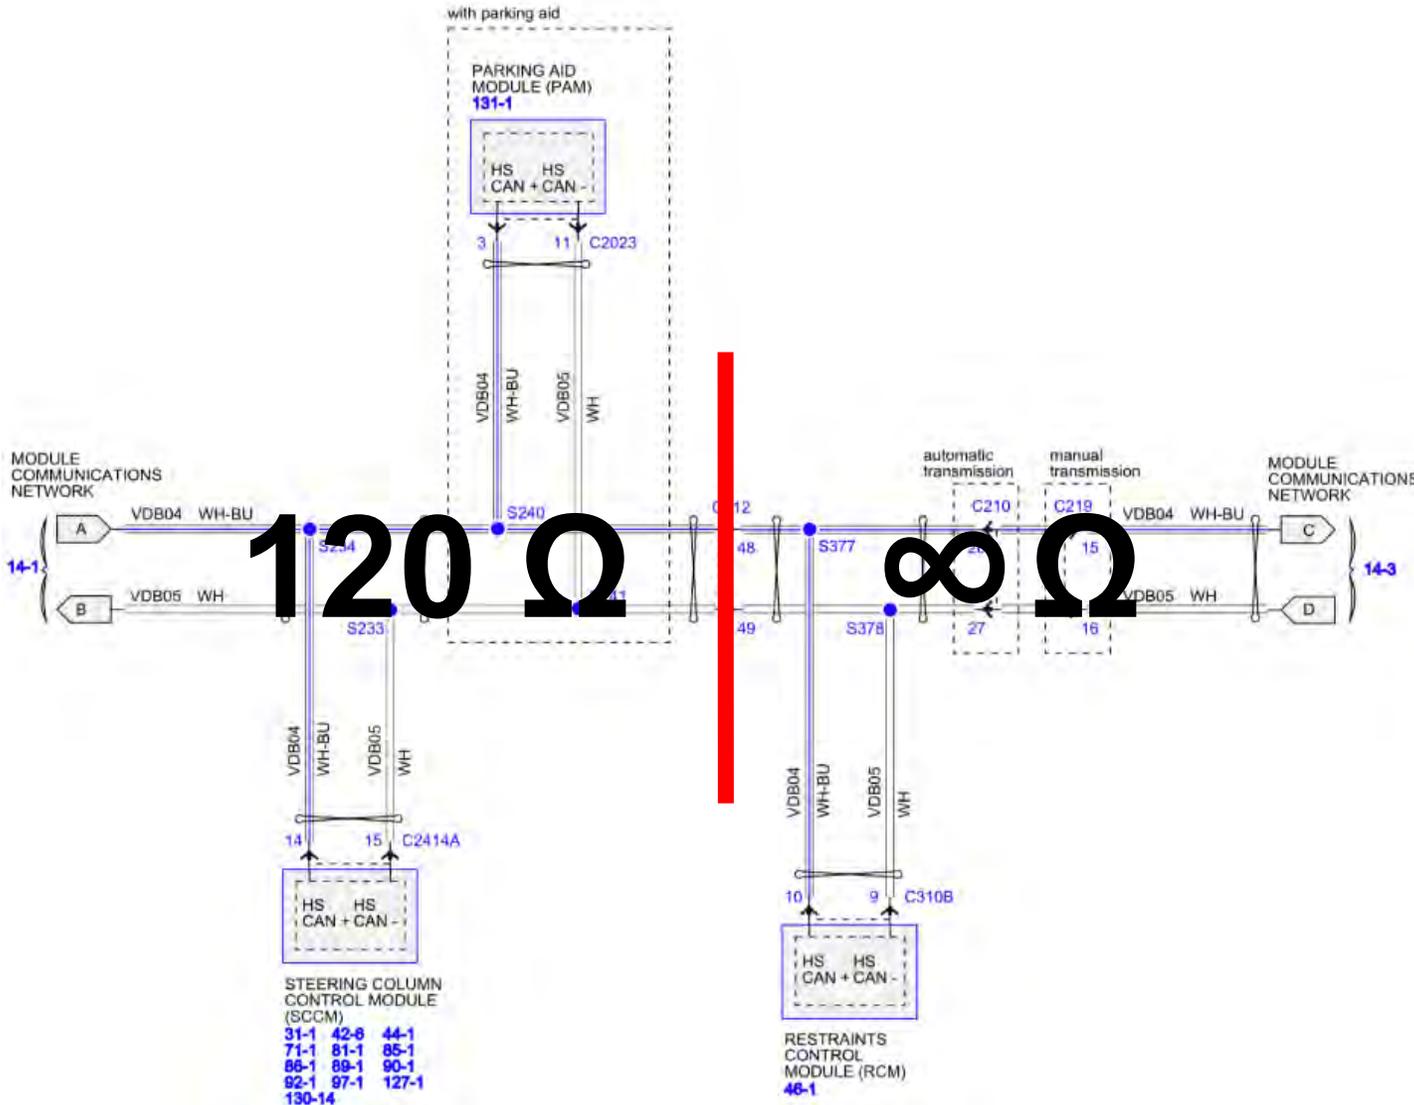

How can this help?

Build a Plan!

We can now see the side of the network with the issue..

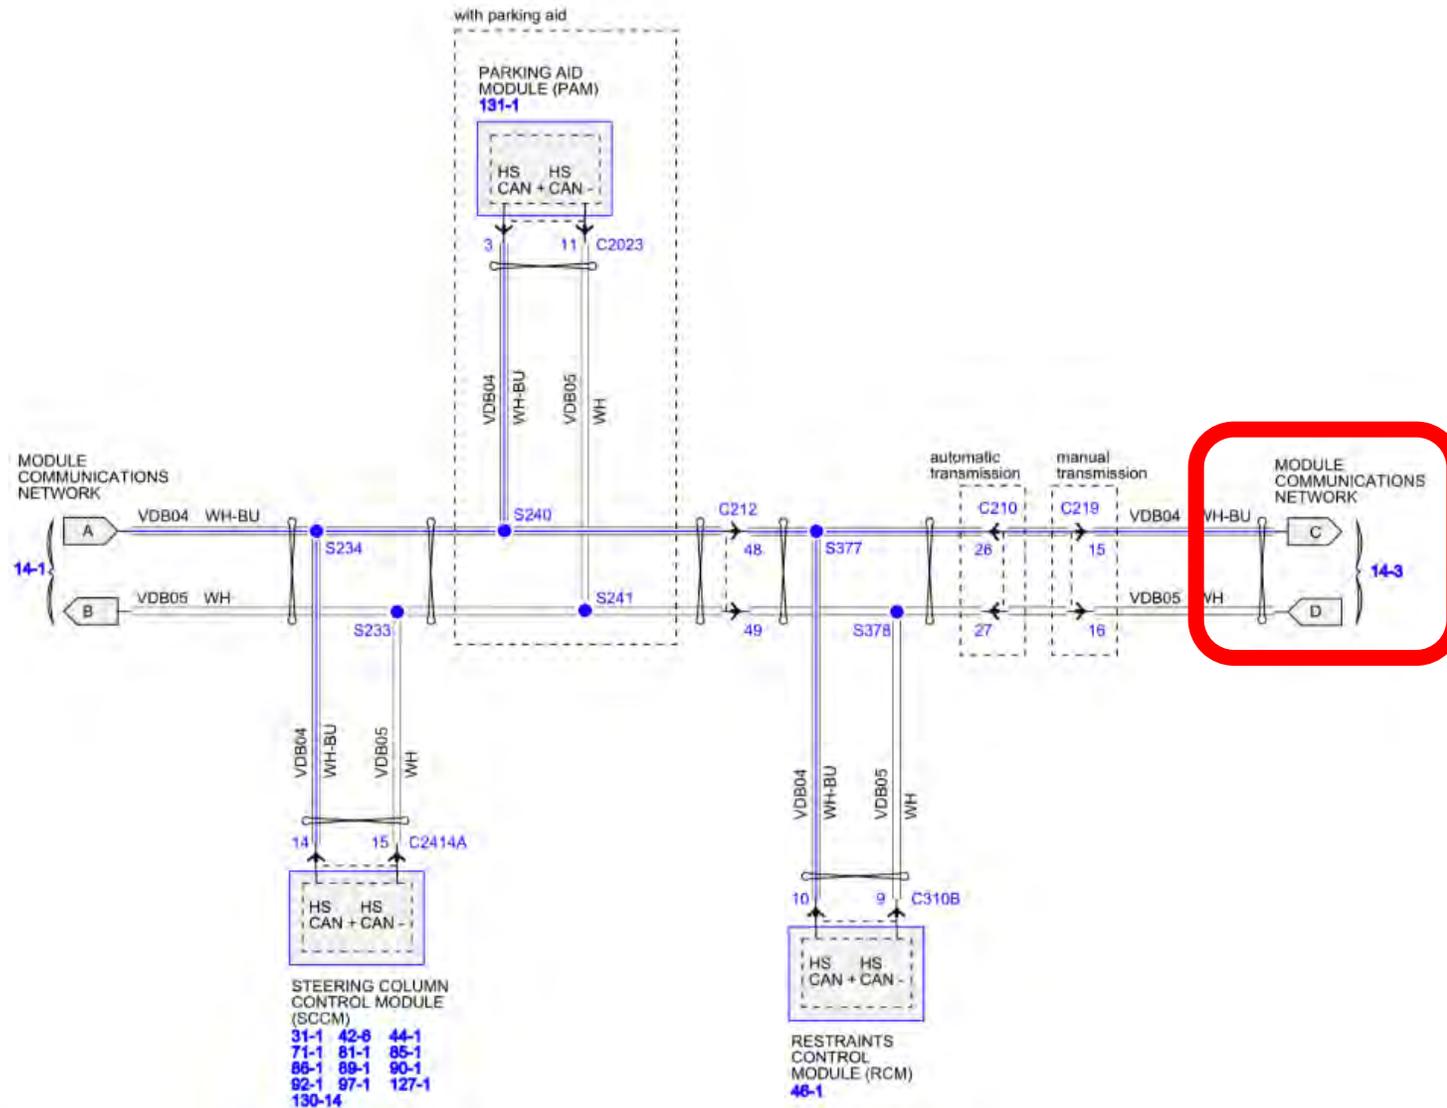

At this point, we just continue down the line to isolate the concern even farther.....

But do we really need to?

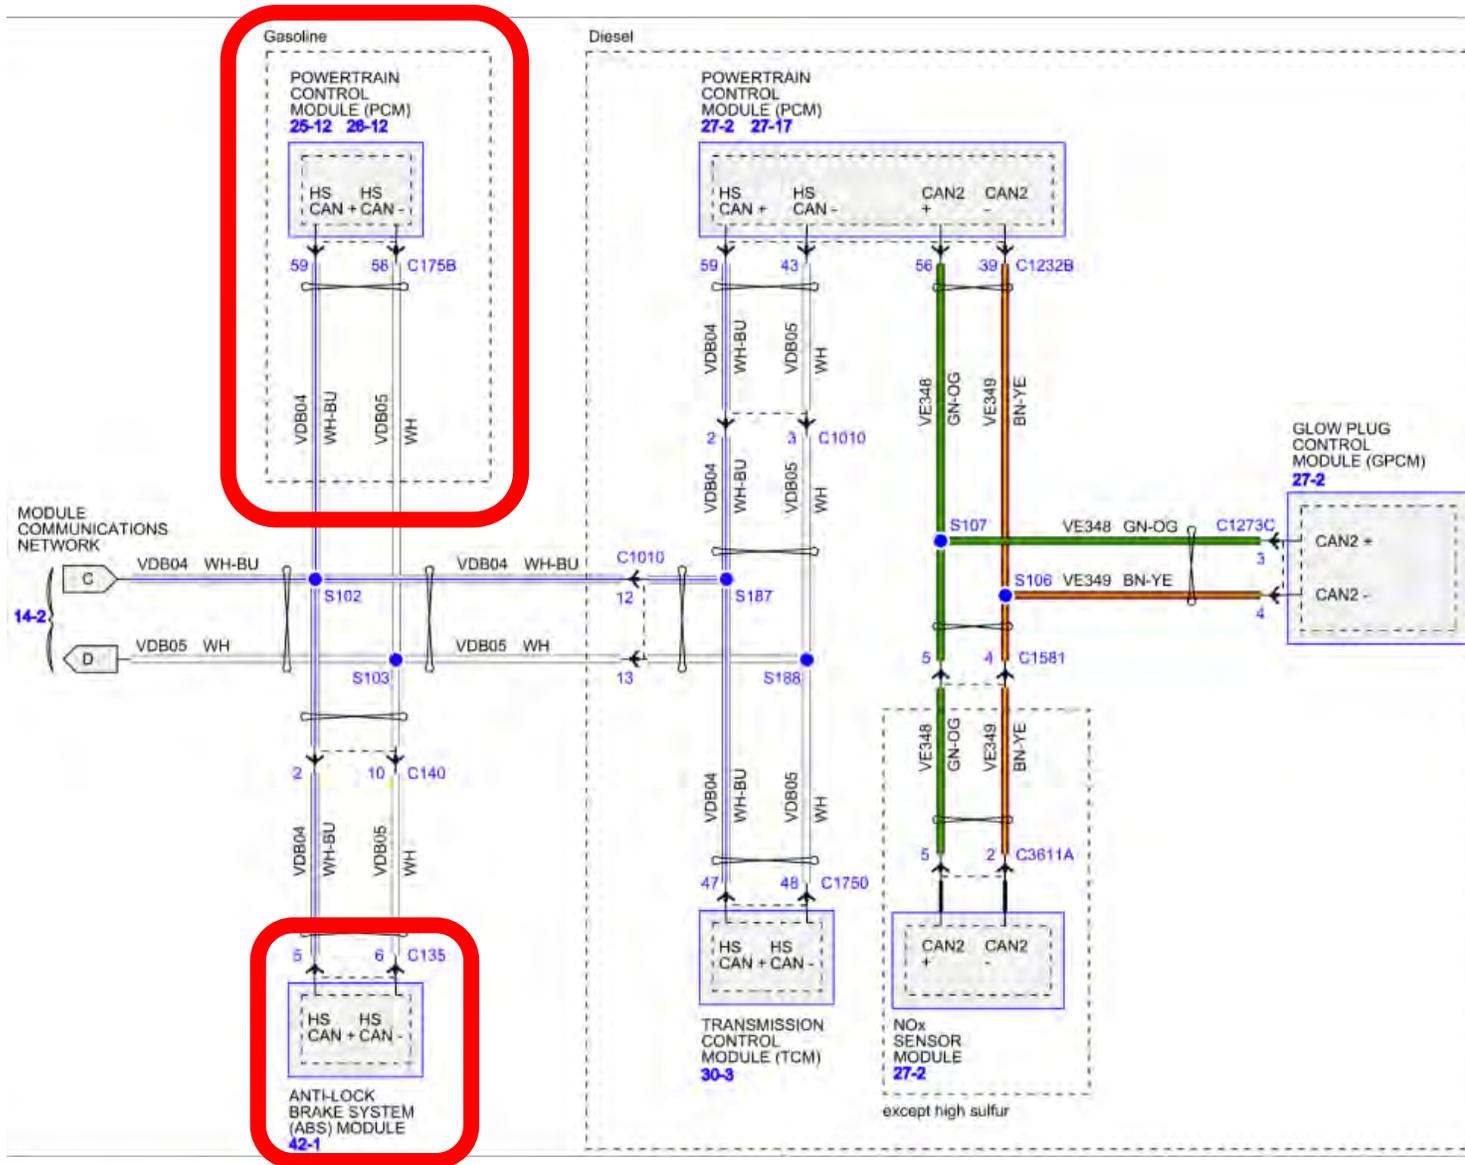

Build a Plan!

Look closer at the diagram..

Build a Plan!

Look closer at the diagram..

What was our concern?

And where would we logically test?

Live Network Test

The screenshot displays a software interface for vehicle network monitoring. At the top, there are tabs for 'Vehicle Identification', 'Toolbox', 'Measurement Toolbox', 'Self Test', and 'Network Monitor'. The 'Network Monitor' tab is active, showing a status bar with buttons for 'Stop', 'Reset', 'Enable All', and 'Beep Disabled'. A message 'Checking response from SODL' is displayed. Below this, there are five 'Enabled' buttons with a count of '0'. The main area is divided into sections for different network nodes: 'HS2' and 'HS3'. The 'HS2' section is highlighted with a red border and contains a grid of modules with their counts and status:

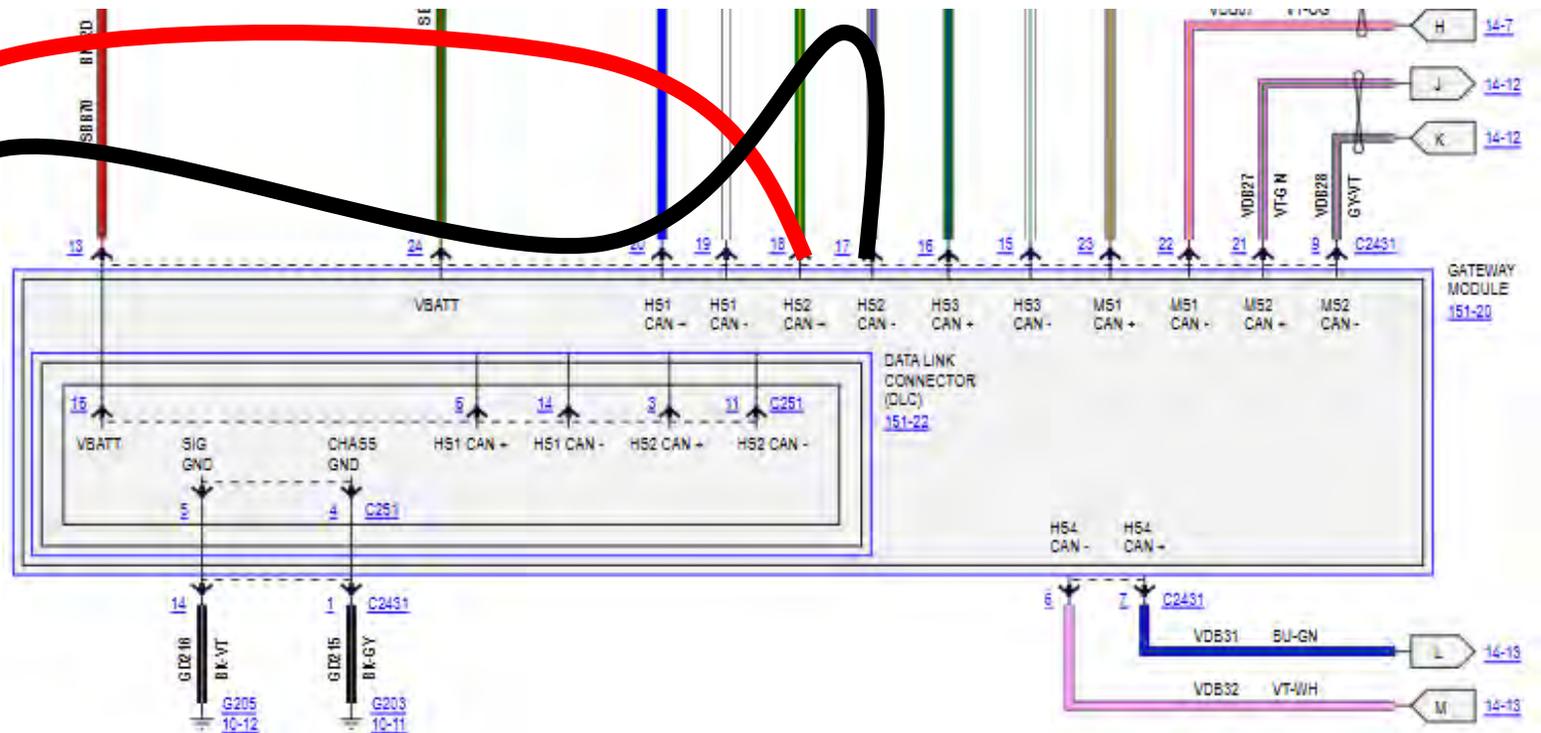

Module	Count	Status
ABS	2	Enabled
CCM	2	Enabled
GWM	0	Enabled
IPMA	2	Enabled
IPMB	2	Enabled
PSCM	2	Enabled
RGM	2	Enabled
SASM	2	Enabled
SCCM	2	Enabled
SECM	2	Enabled
TBM	1	Enabled
TCCM	1	Enabled

The 'HS3' section shows 'ACM' with a count of '0' and status 'Enabled'. Below this, there is a large green button labeled 'HS2 Network Enabled' with a dropdown arrow. At the bottom left, the vehicle ID '1FT8W2BT6LED03425' is visible. The bottom right corner shows system tray icons for network, volume, and power.

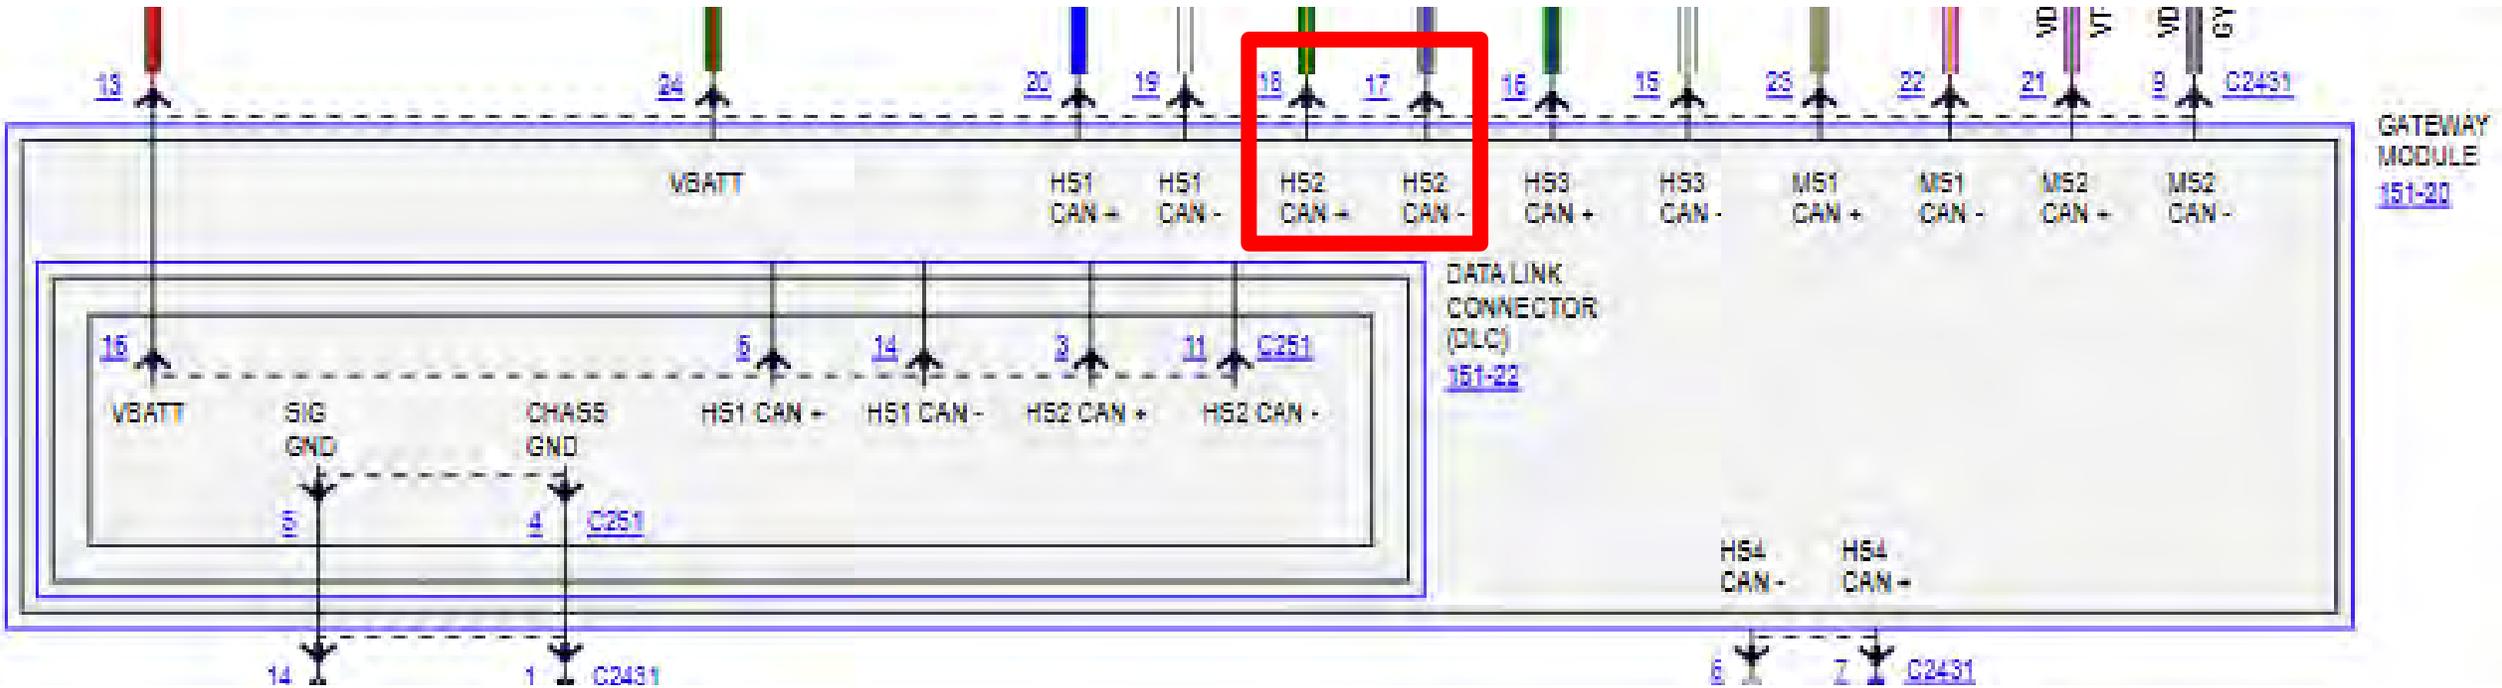

Base Line Resistance Test

TECH NOTES:

Disconnected gateway and checked resistance at back of gateway connector, found 2.7 ohms. Network lines are shorted somewhere on HS CAN2, will need additional time to trace short.

PCM No Communication – Where Do You Start?

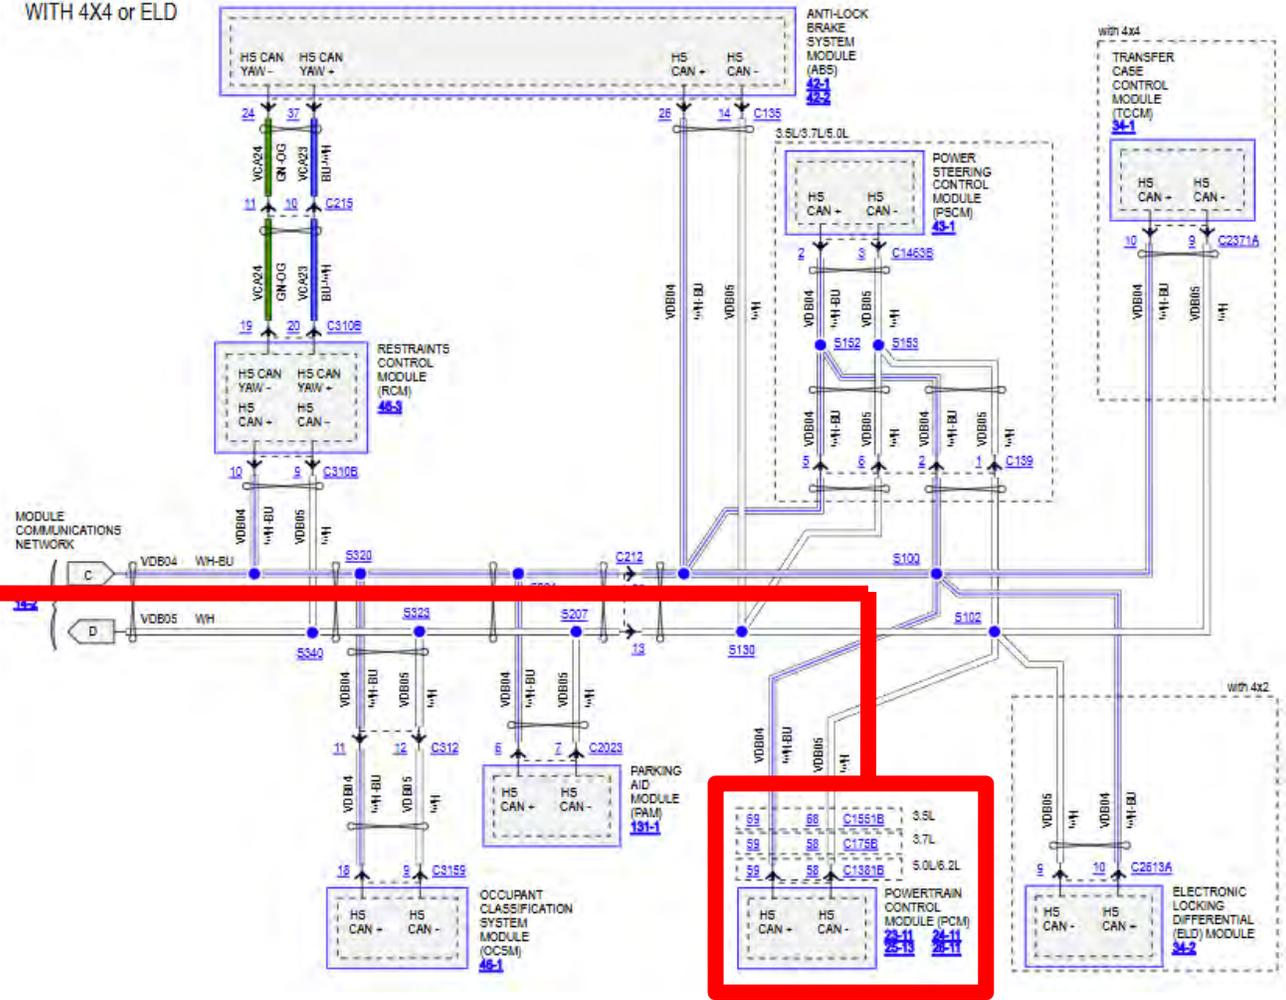

Module Communication “Basics”

- **Power Supply** to B+
- **Power Supply** to Ignition Sources
- **Wake-Up Signals** (If Applicable)
- **Ground Supply** to Module
- **Communication Signal Integrity** to Module from Communication Network
- **POWERS, GROUNDS & COMMS!**

Communication Integrity

WITH 4X4 or ELD

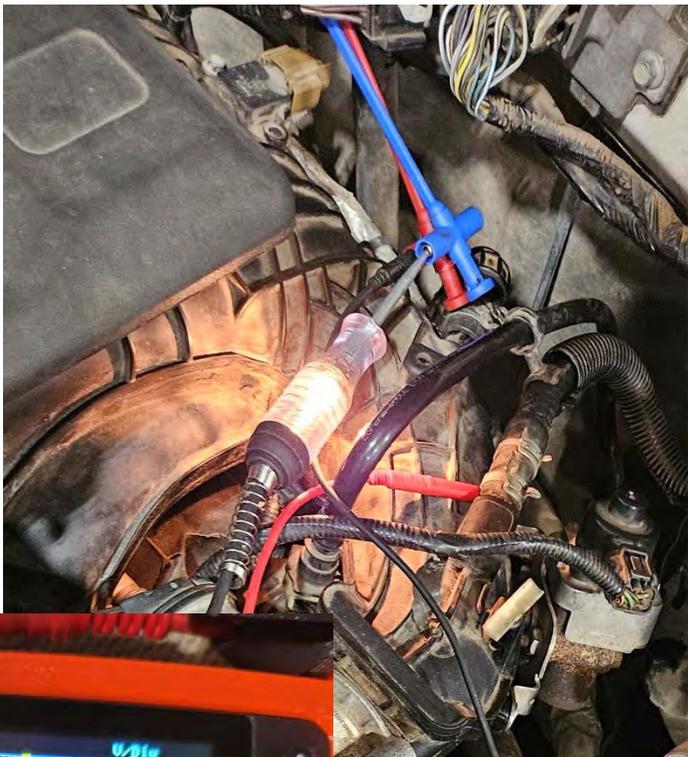

Build a Test Plan Based on Data!

Where do we start?

- Does communication integrity make sense, when applied to the symptoms present?
- Voltage drop **Powers, Grounds & Wake-Up** signal at the PCM to test the PCM (**Under the failure condition**)

Check all Circuits Under the Failure Mode

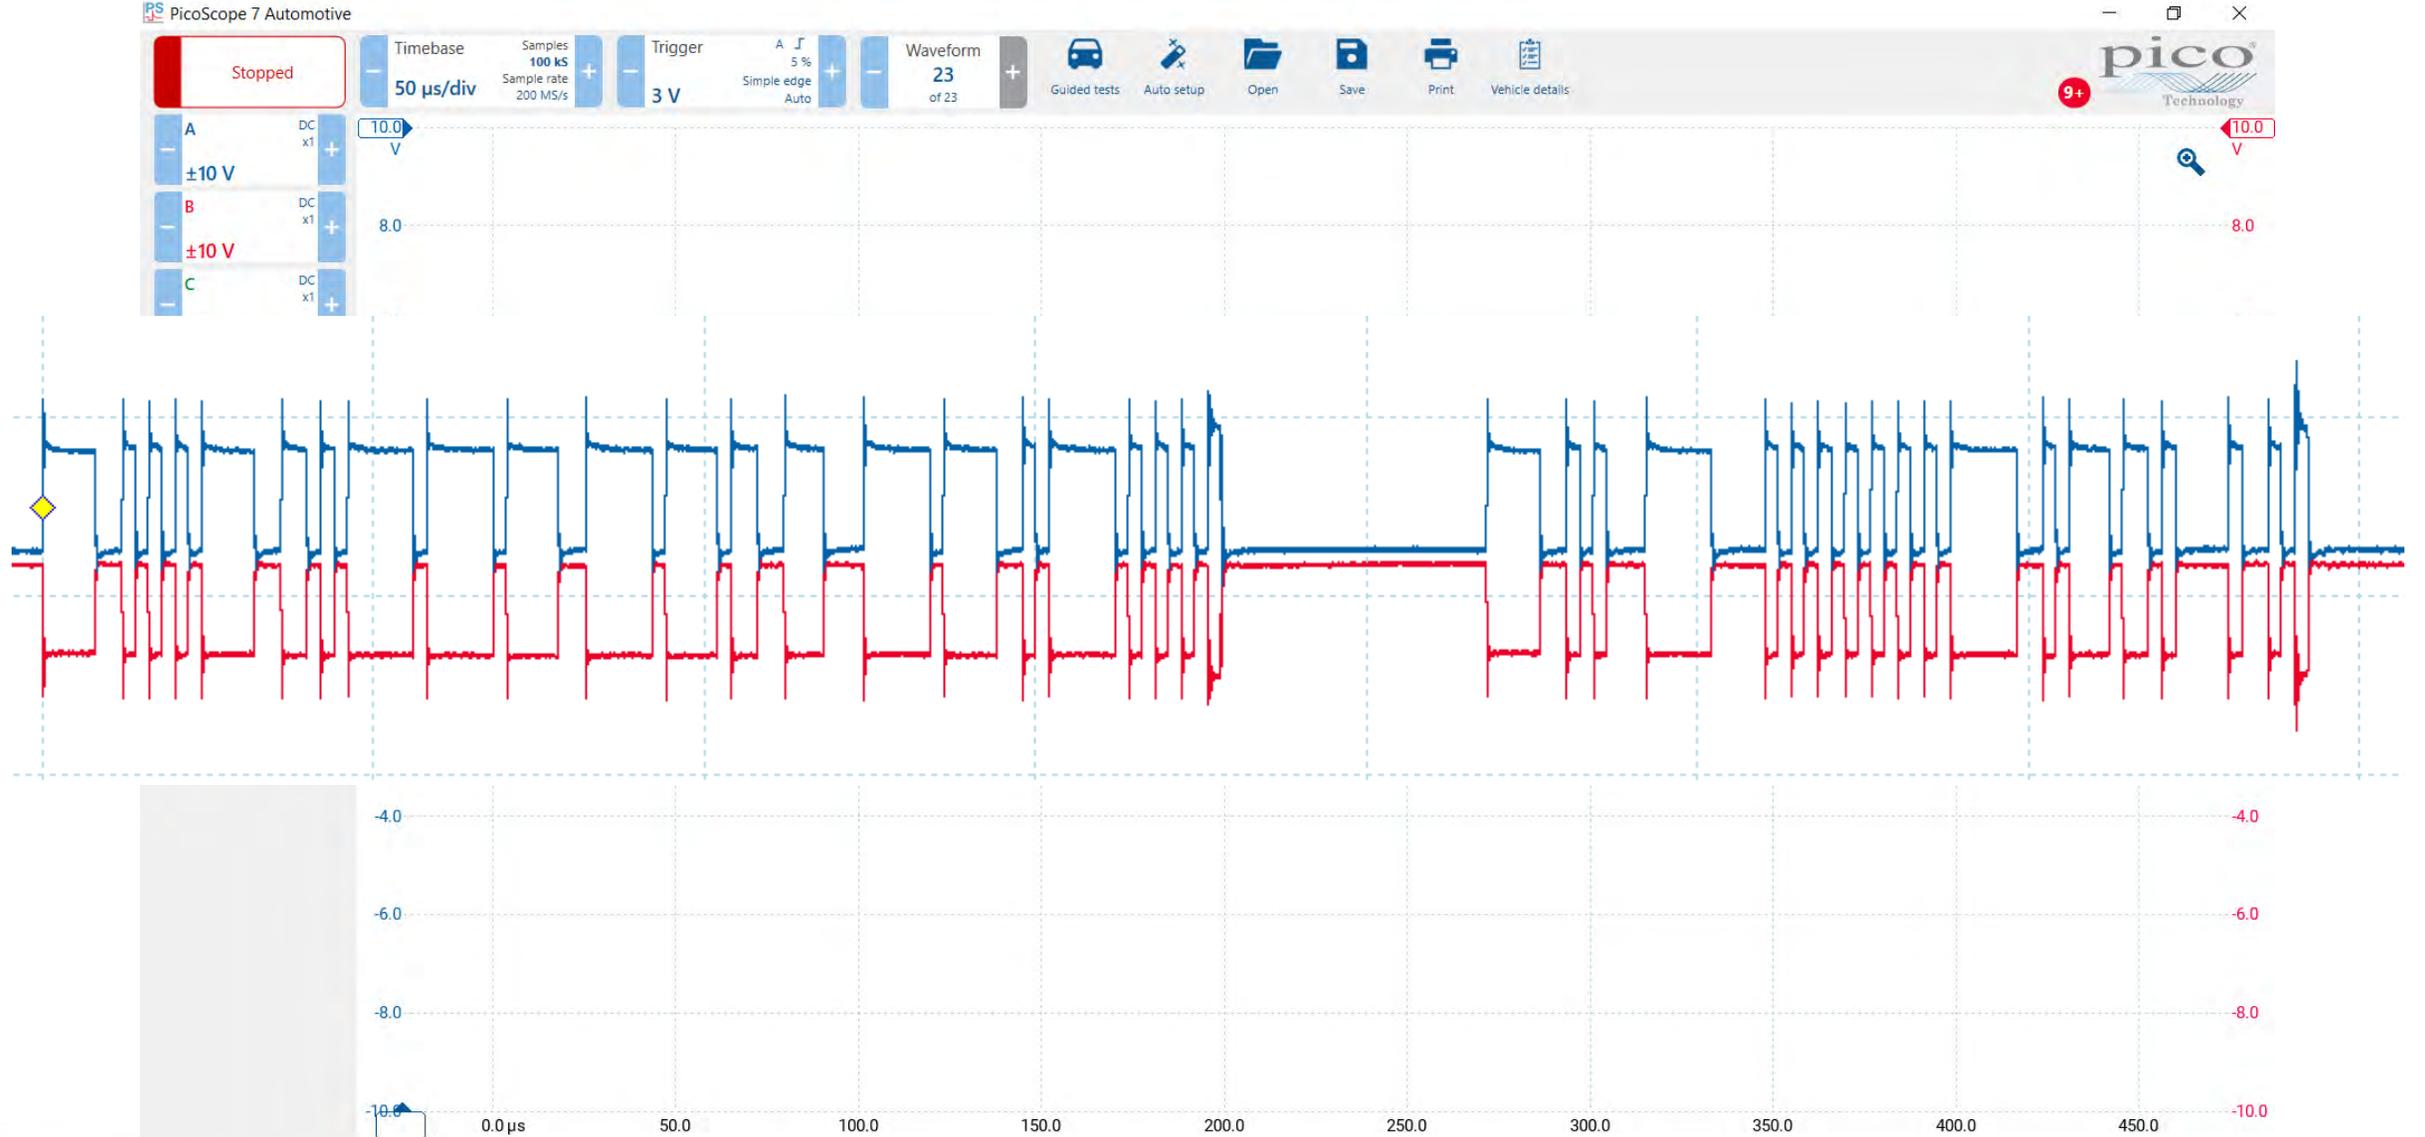

- Voltage dropped while plugged in and under the failure mode. Test were within **“specification”**
- All 3 B+ circuits test “within spec”
- ISPR test “within spec”
- Wake-Up circuit test “within spec”
- All 3 Grounds test “within spec”

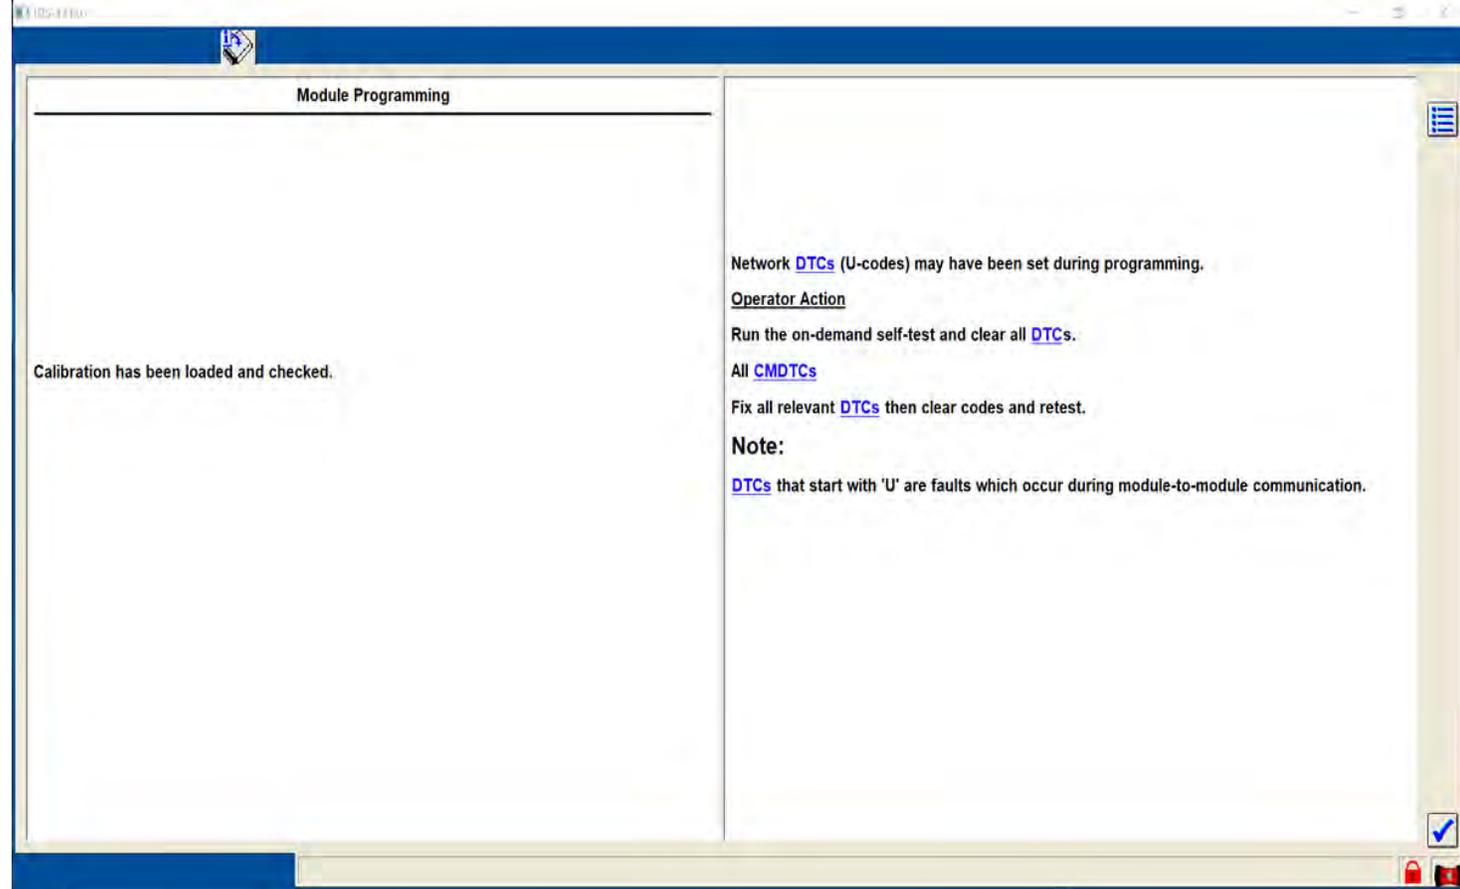

LESS THAN .3 Vdc DROP LOADED!!!

WE USED A SCOPE & TESTLIGHT

Communication Circuit? (PCM Plugged In)

Dead to Rights! Powers, Grounds & Comms!

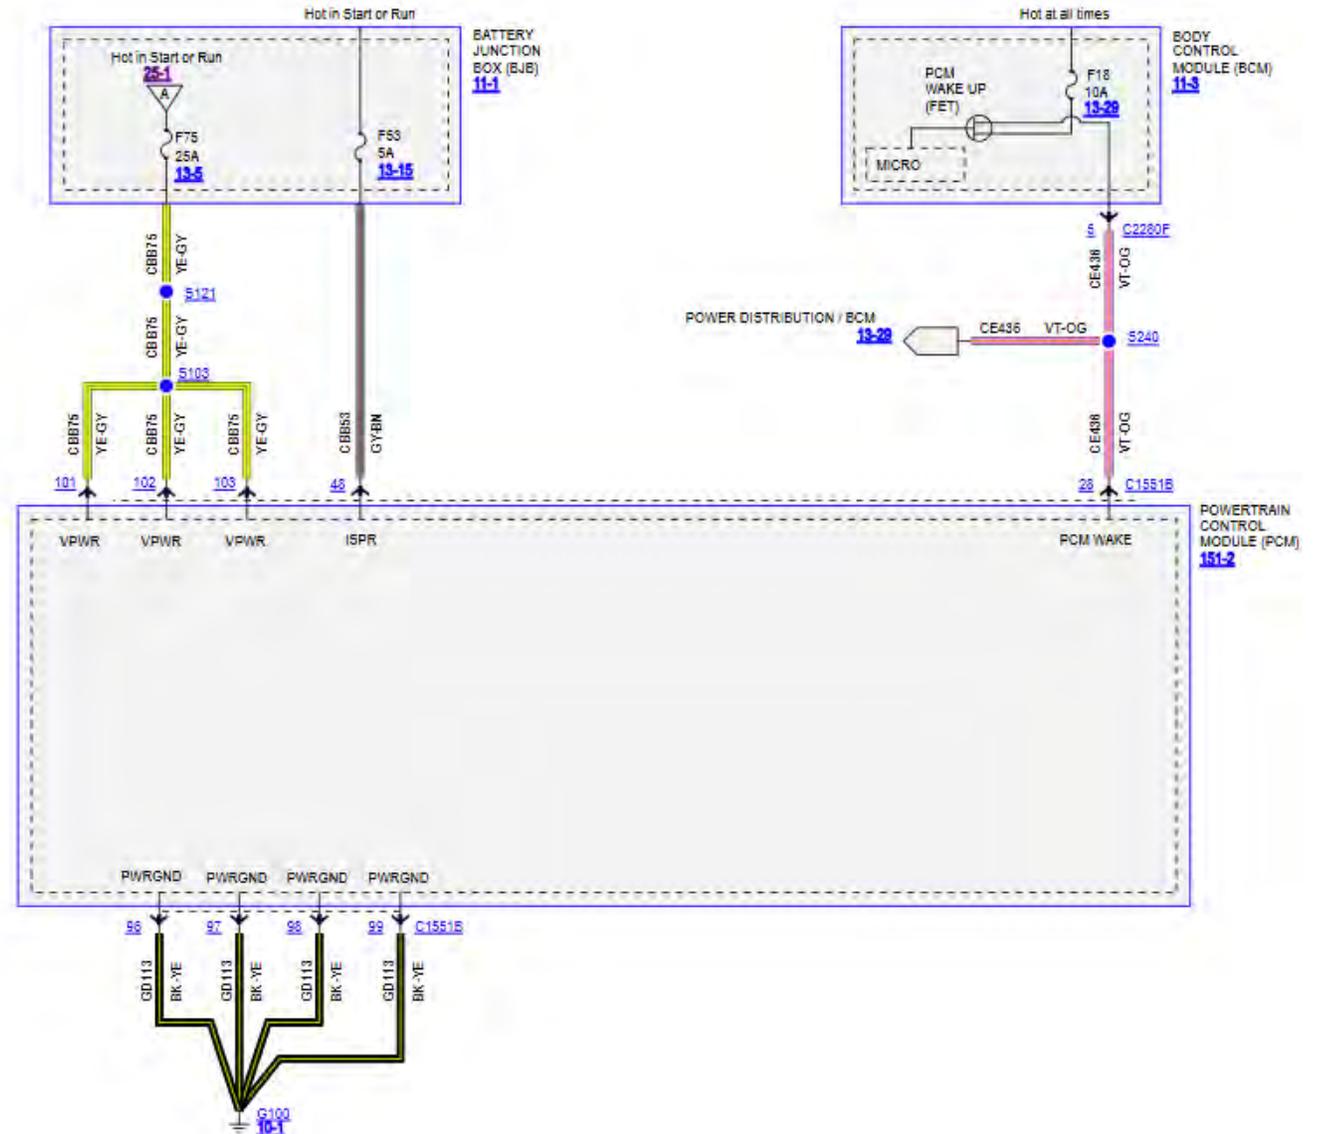

Same Issue!

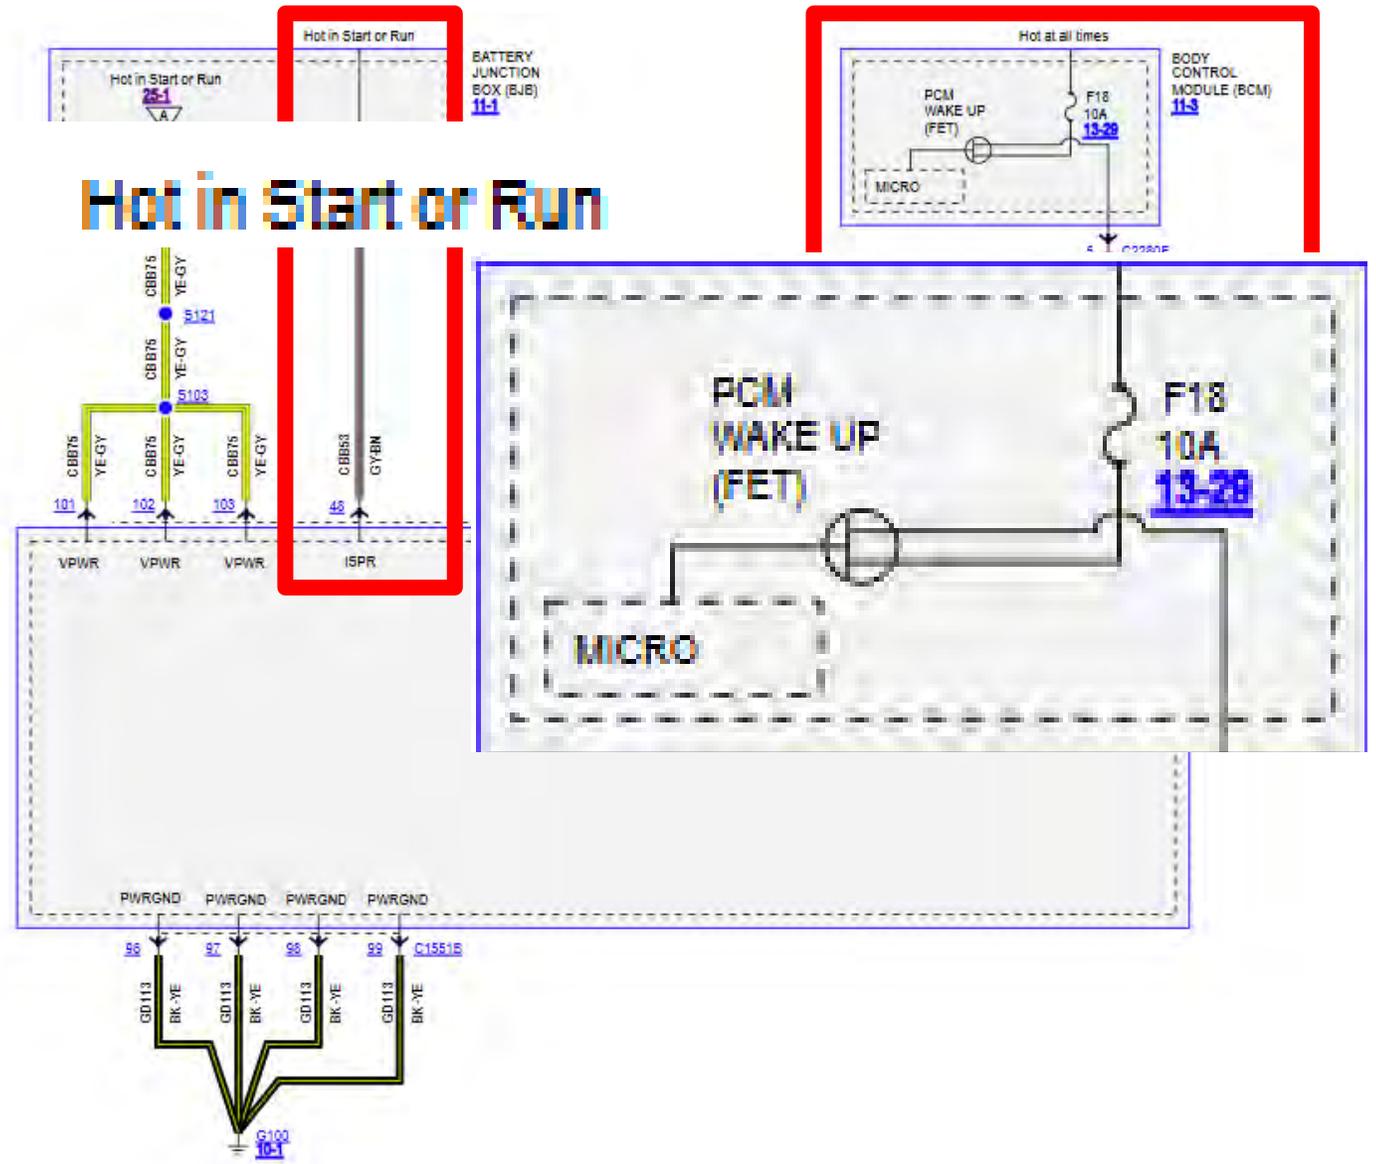

Where did we/they go wrong?

- A PCM had already been tried before I performed any testing on the vehicle.
- I may have called for a PCM as well.
- A valuable lesson was about to be learned!
- Think about the “**Reset**” conditions...

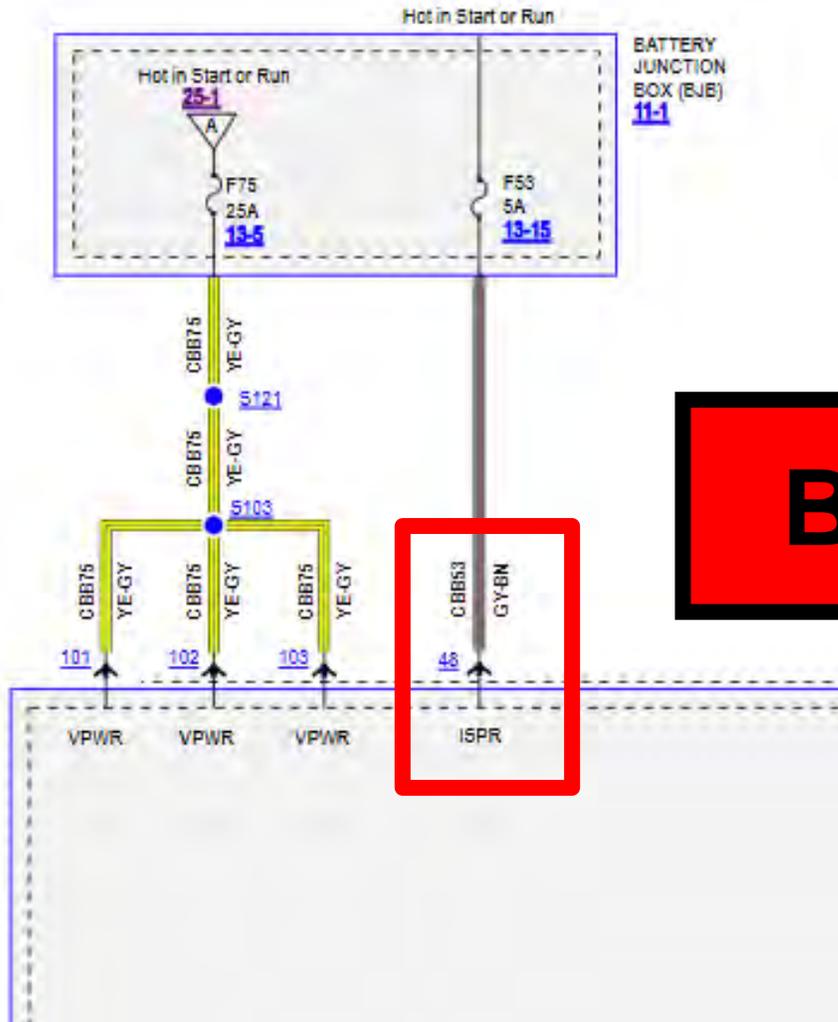

A Closer Look at Wake-Up & Ignition Circuits

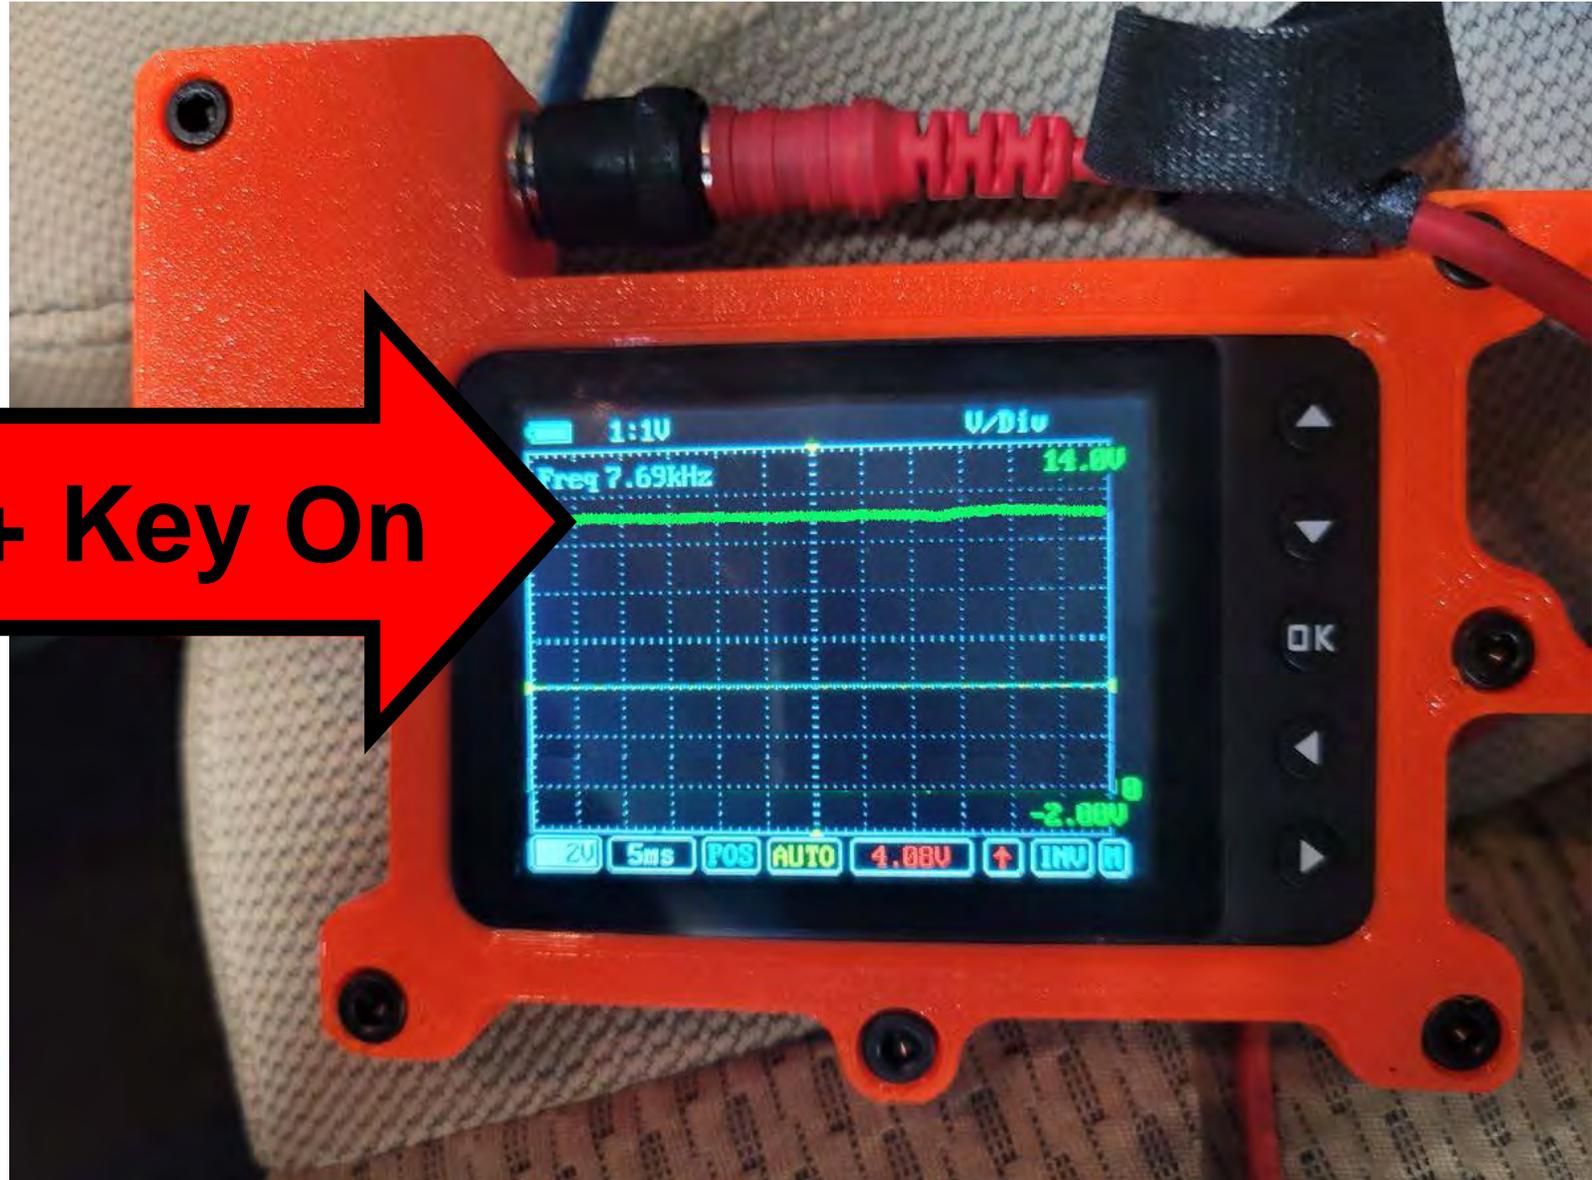

- The wake up signal from the BCM is a simple FET (Field Effect Transistor) circuit that requires provides B+ on and Off ONLY in this circuit.
- Similar design in the “Hot in Start or Run” circuit for the ISPR (Ignition Switch Position Run) circuit.

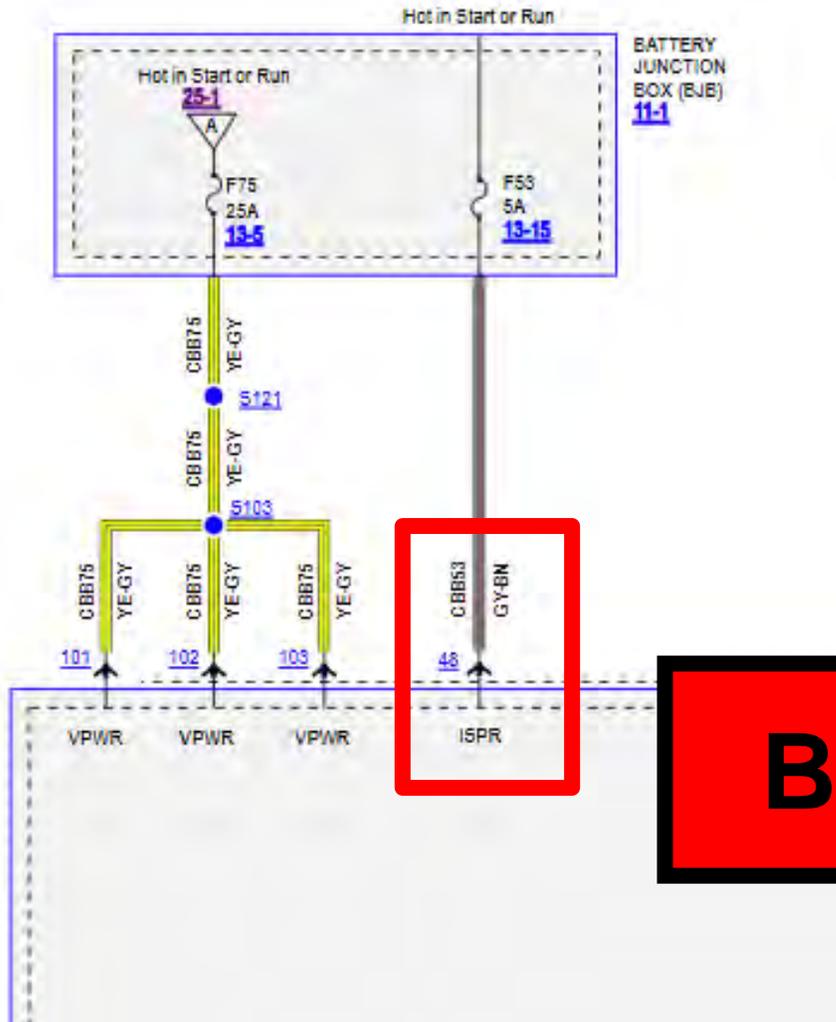

What is happening? Key On (ISPR)

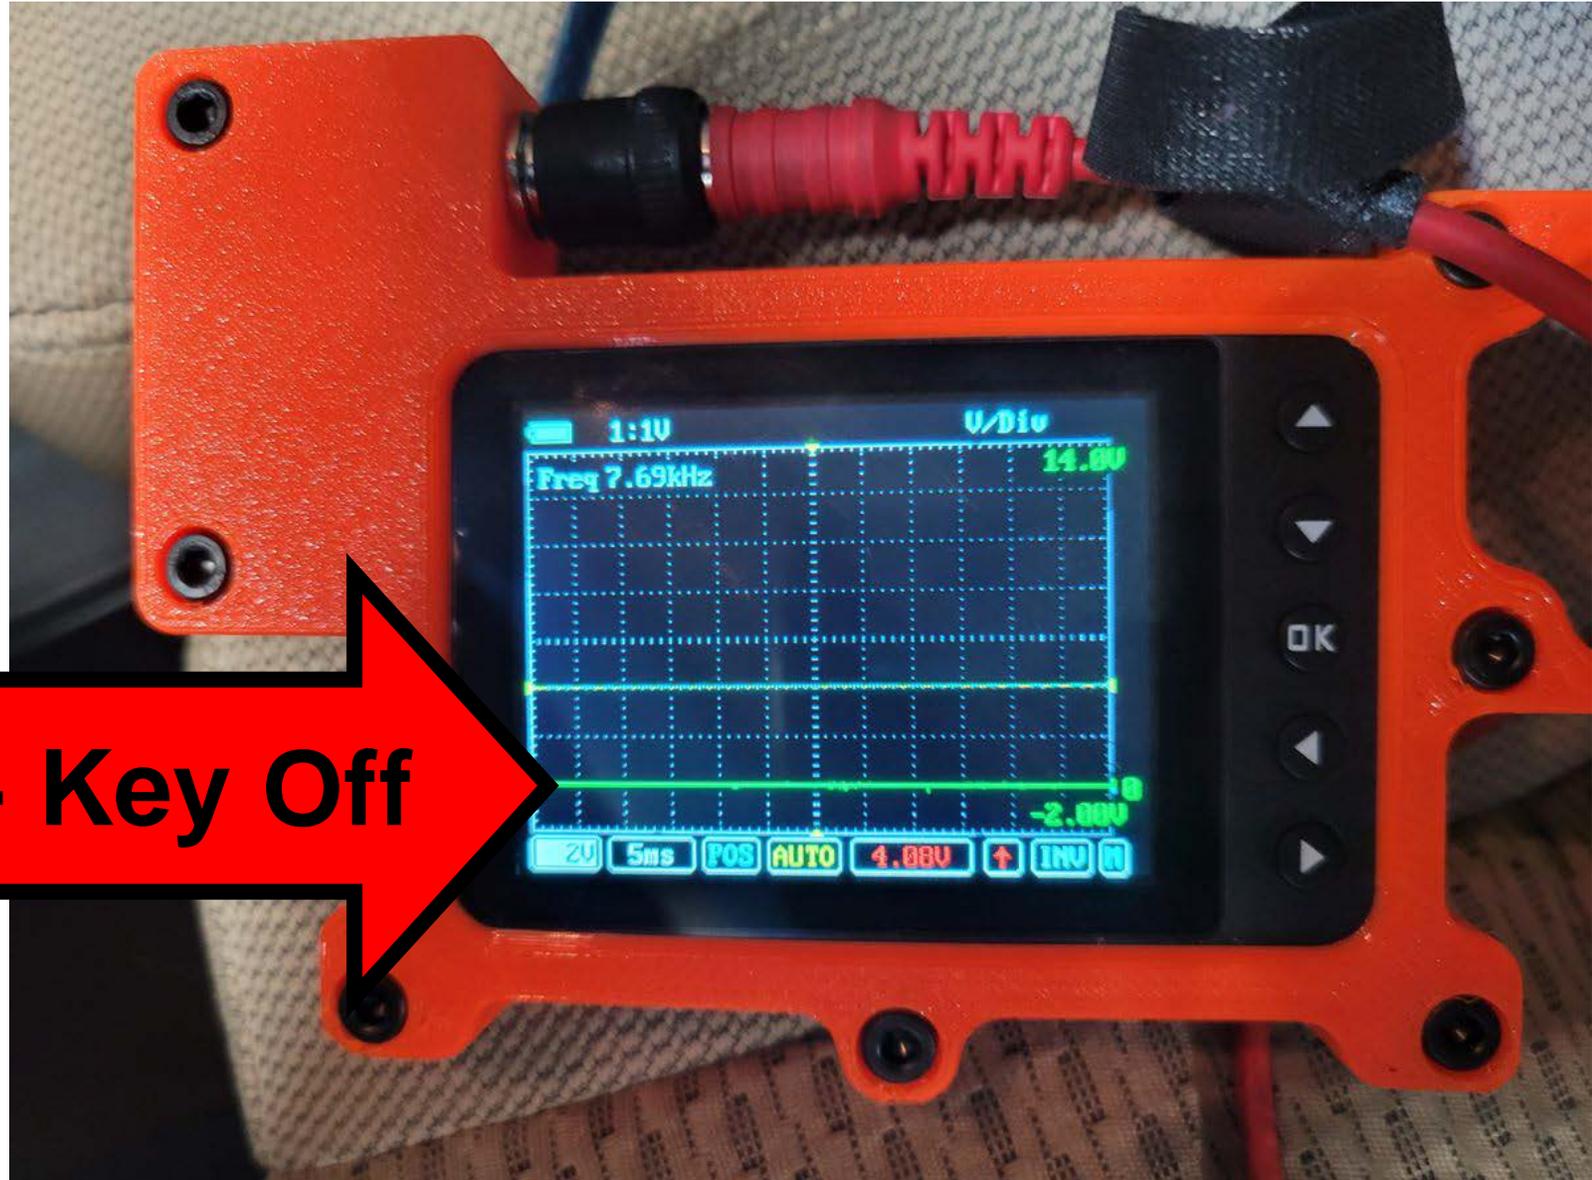

B+ Key On

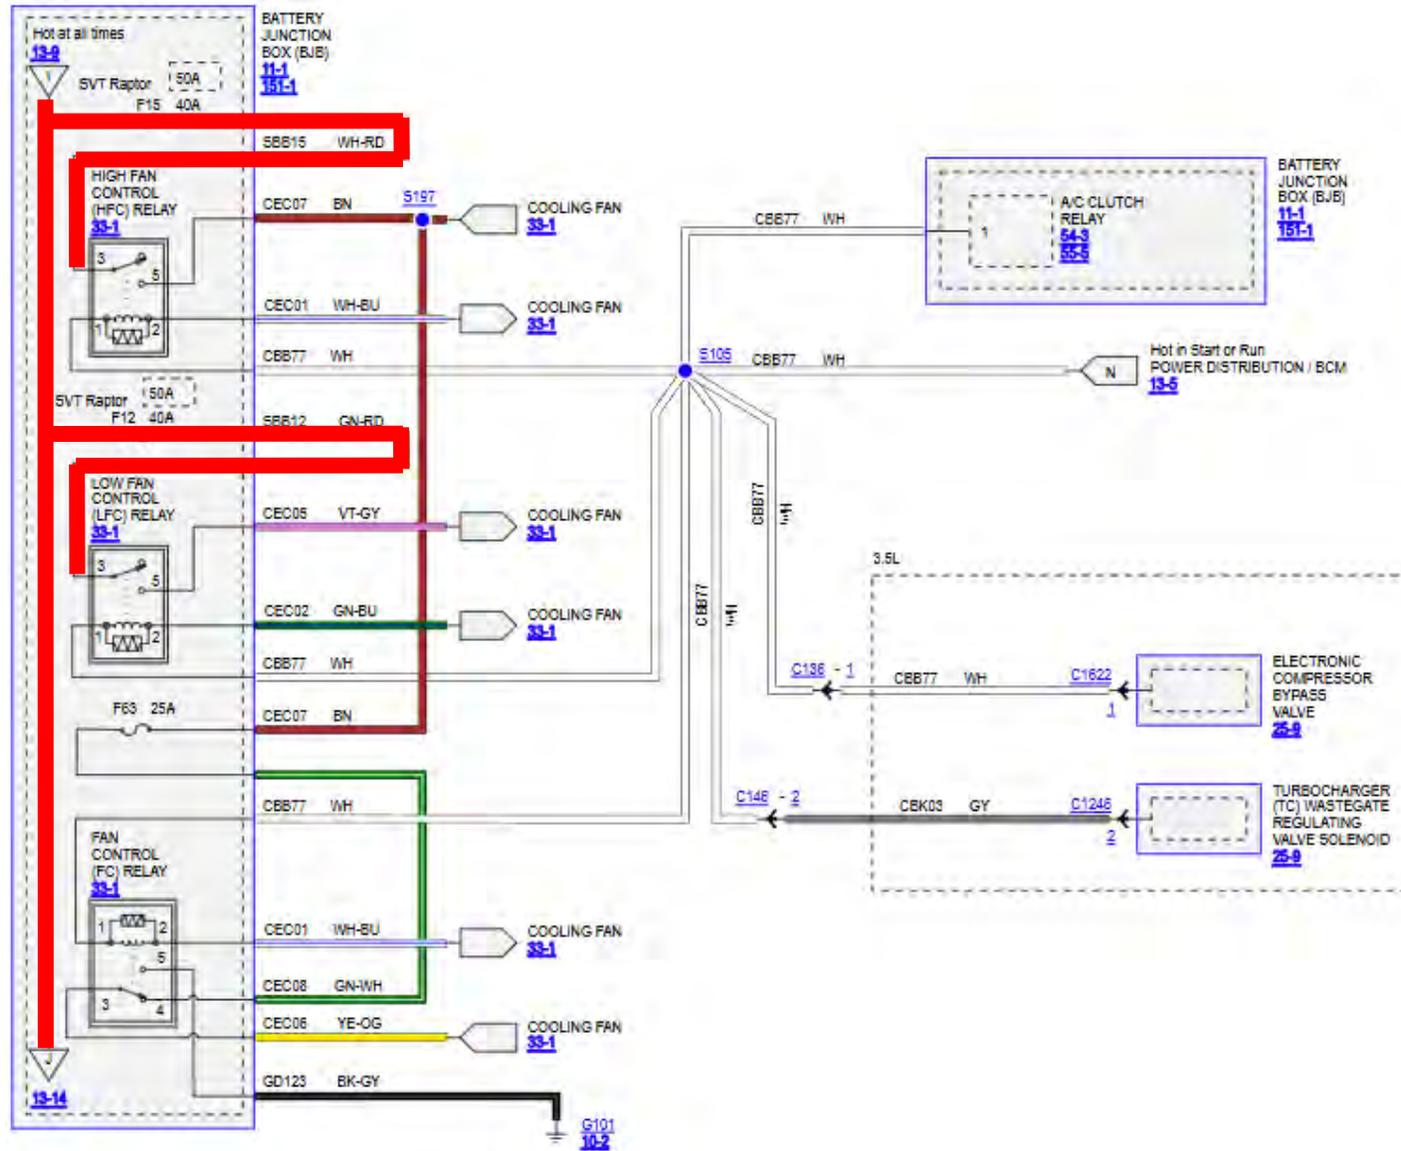

What is happening? Key OFF (ISPR) NOT BROKEN

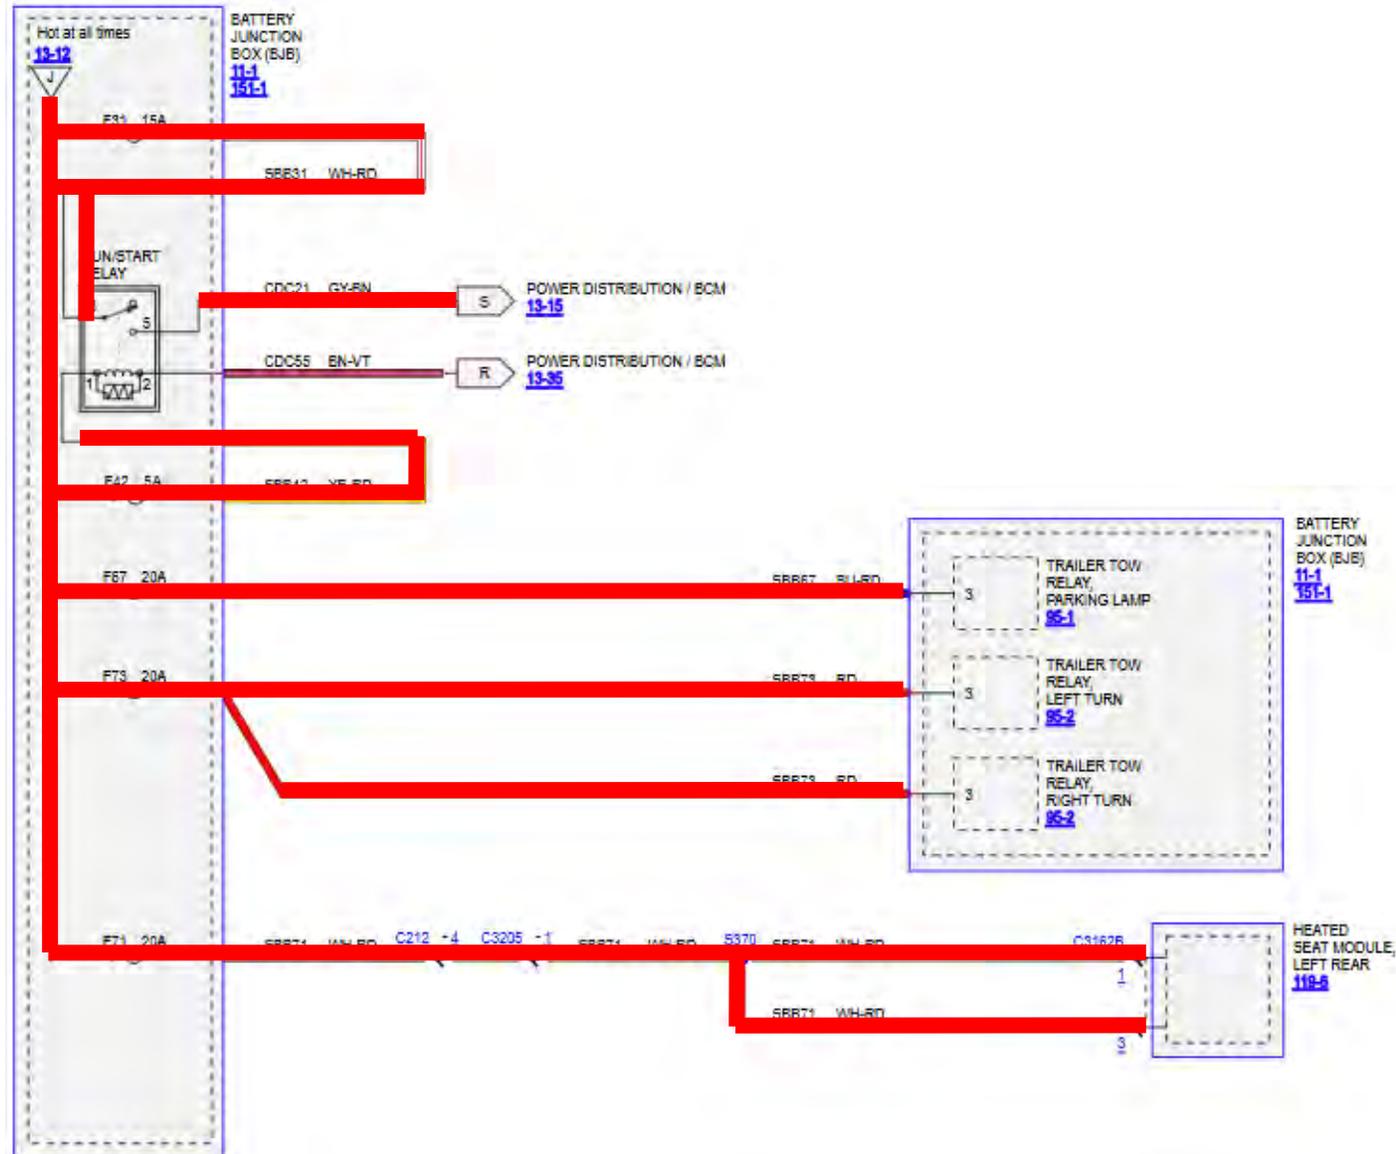

B+ Key Off

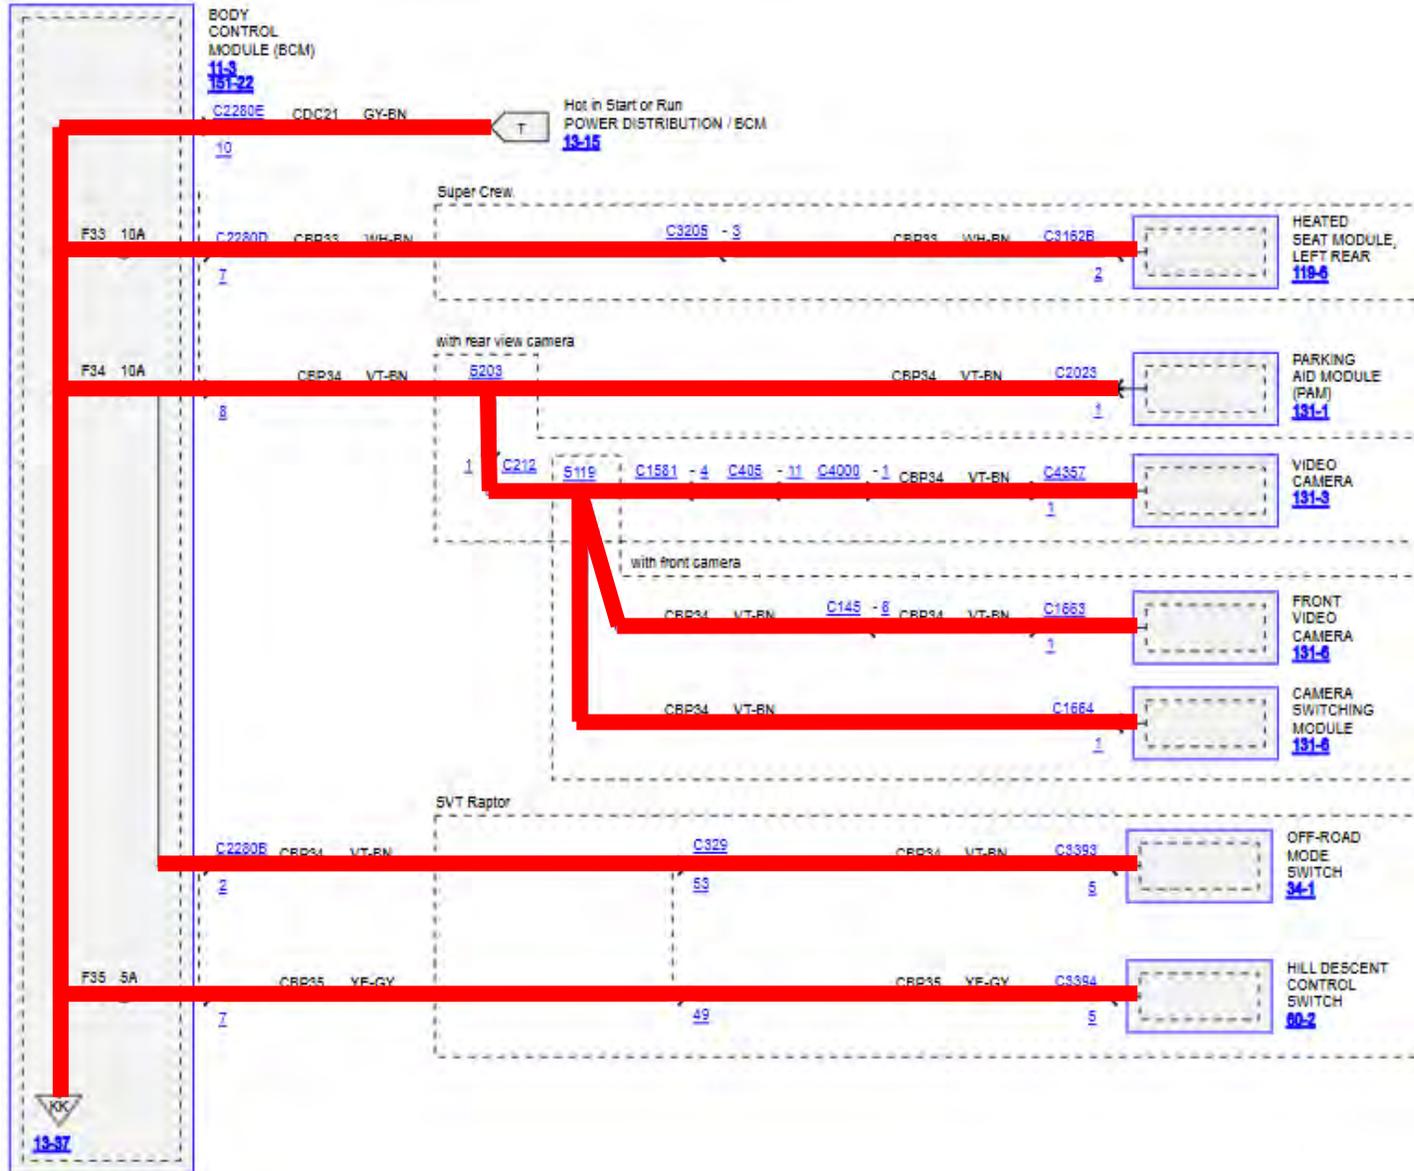

The research begins! Where can the ISPR be shorted!

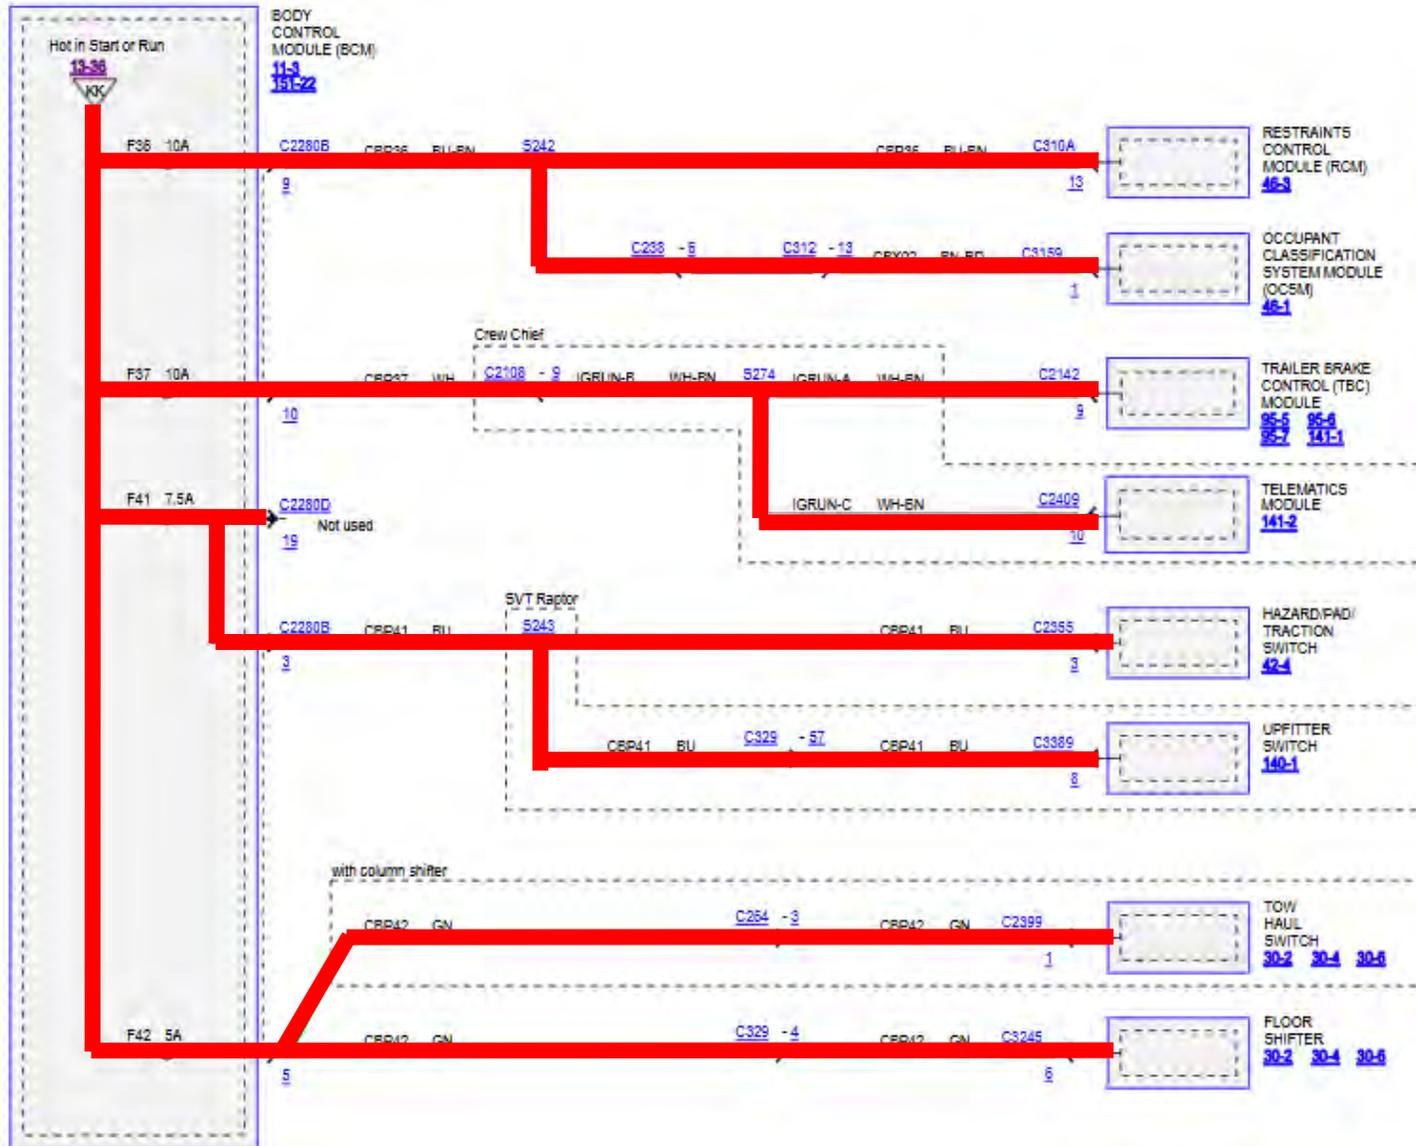

The research begins! Where can the ISPR be shorted!

The research begins! Where can the ISPR be shorted!

The research begins! Where can the ISPR be shorted!

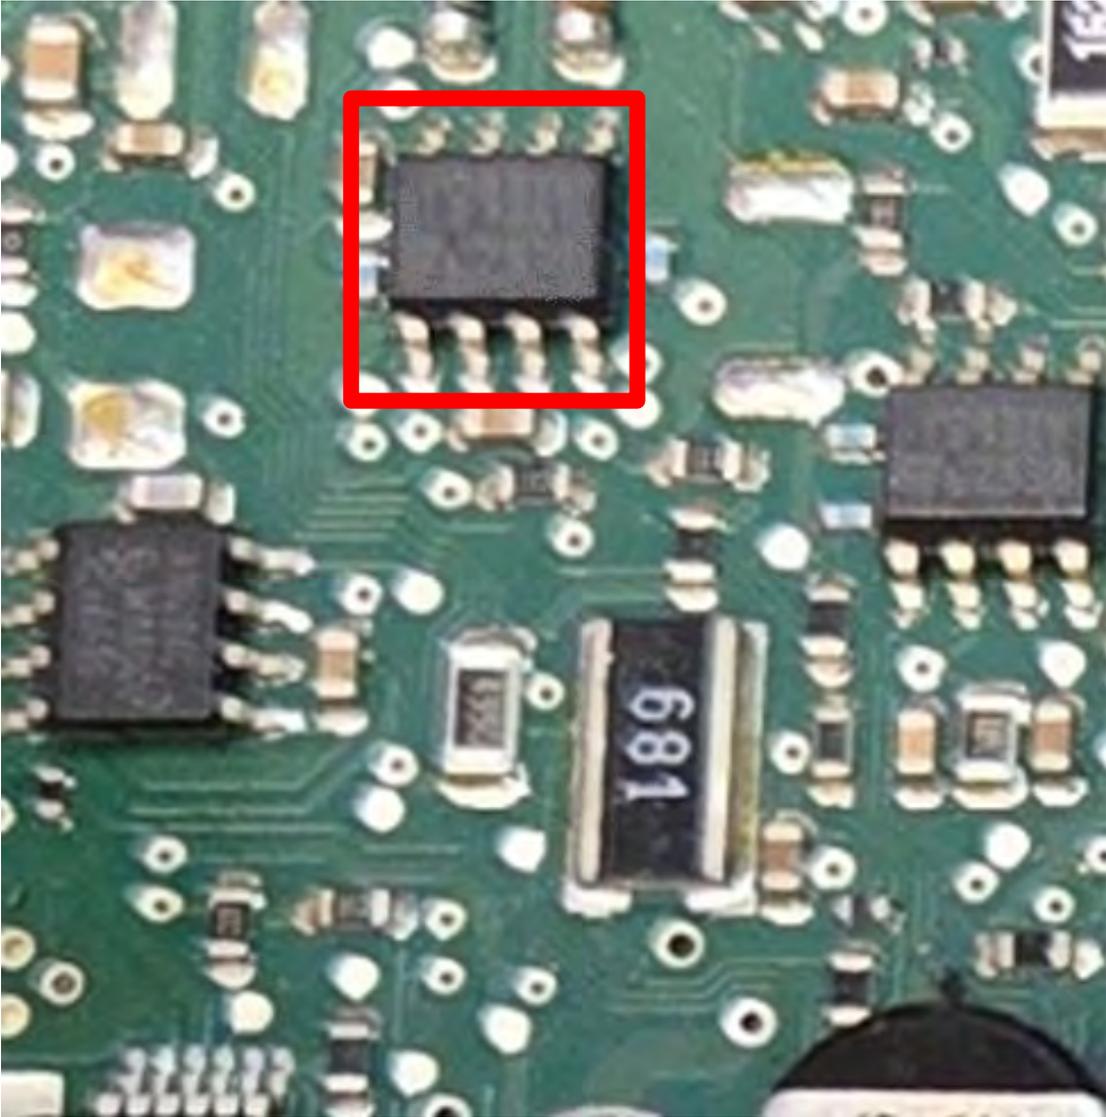

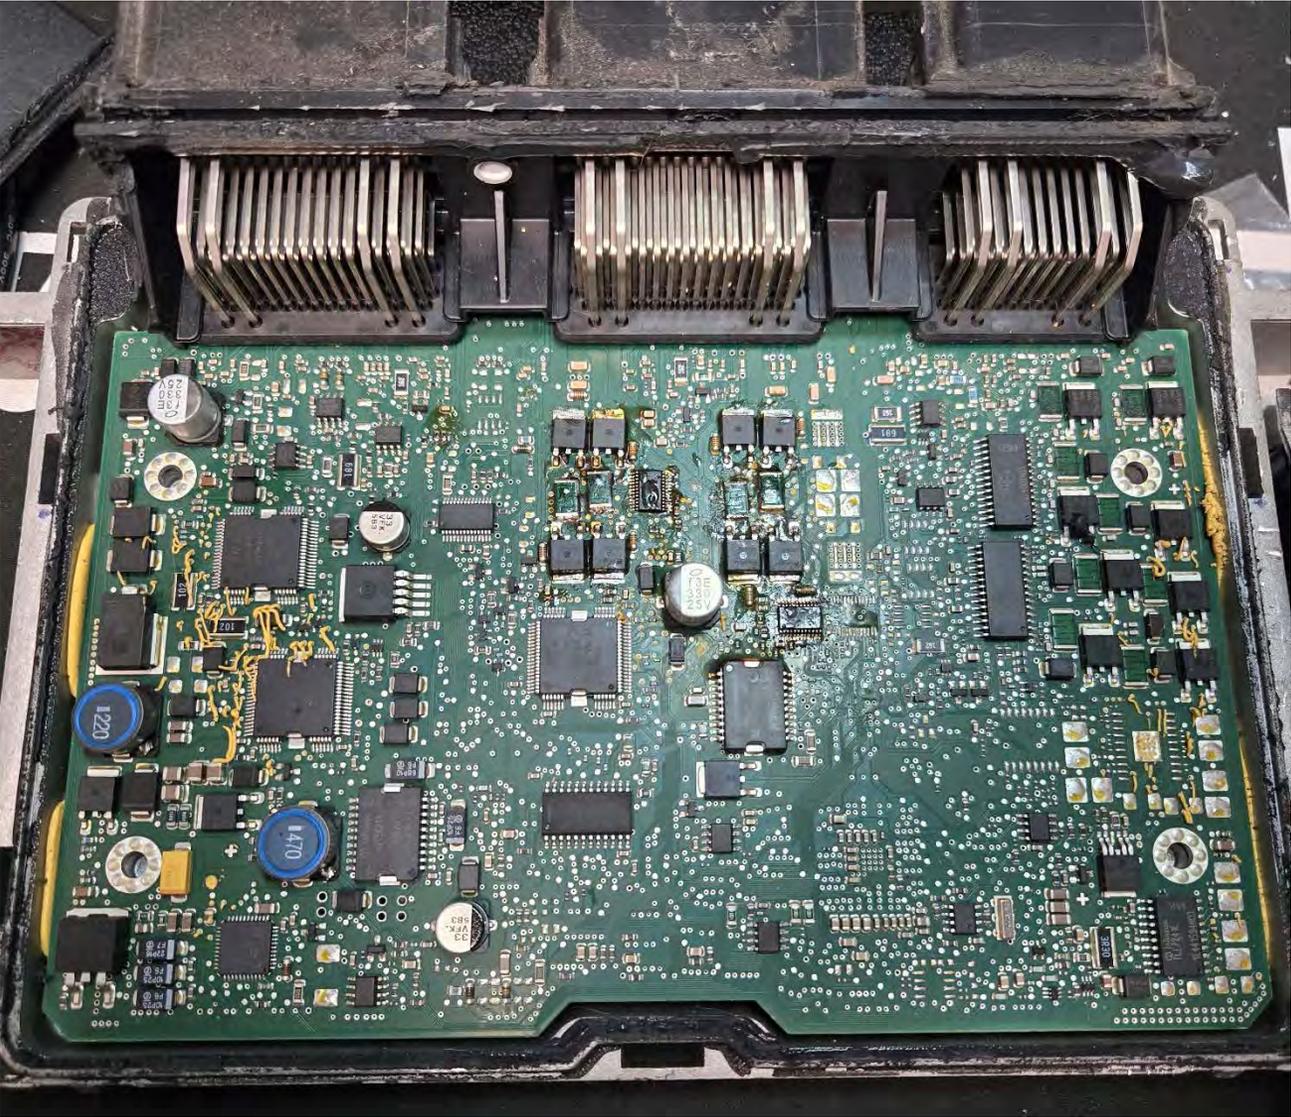

Why is it this way?

Let's get this module open and look at the ISPR circuit!!!

The module is opened, and we research the component(s) that are powered by the ISPR circuit.

What's in the module?

What do we do with this information?

The image shows a Google search for "TPS3711 Datasheet". The search results list a PDF document from TI.com titled "TPS3711 36-V Voltage Detector datasheet (Rev. B)". Below the search results, a PDF viewer interface is visible, showing navigation controls (page 1 of 24, 100% zoom) and a menu with options: "Ordering & quality", "Technical documentation", "Design & development", and "Support & training". The footer of the document includes the Texas Instruments logo, the part number "TPS3711", and the revision information "SBVS272B – NOVEMBER 2015 – REVISED DECEMBER 2023".

Conclusion!

- **99% of the time Powers, Grounds & Comms will diagnose a module communication issue.**
- **Going beyond regular wiring diagrams and service information tactics can pay off when it's the 1%**
- **Ask how & always ask why.....**
- **You don't know, what you don't know!**

Single Wire Networks (SWCAN, LIN, Etc..)

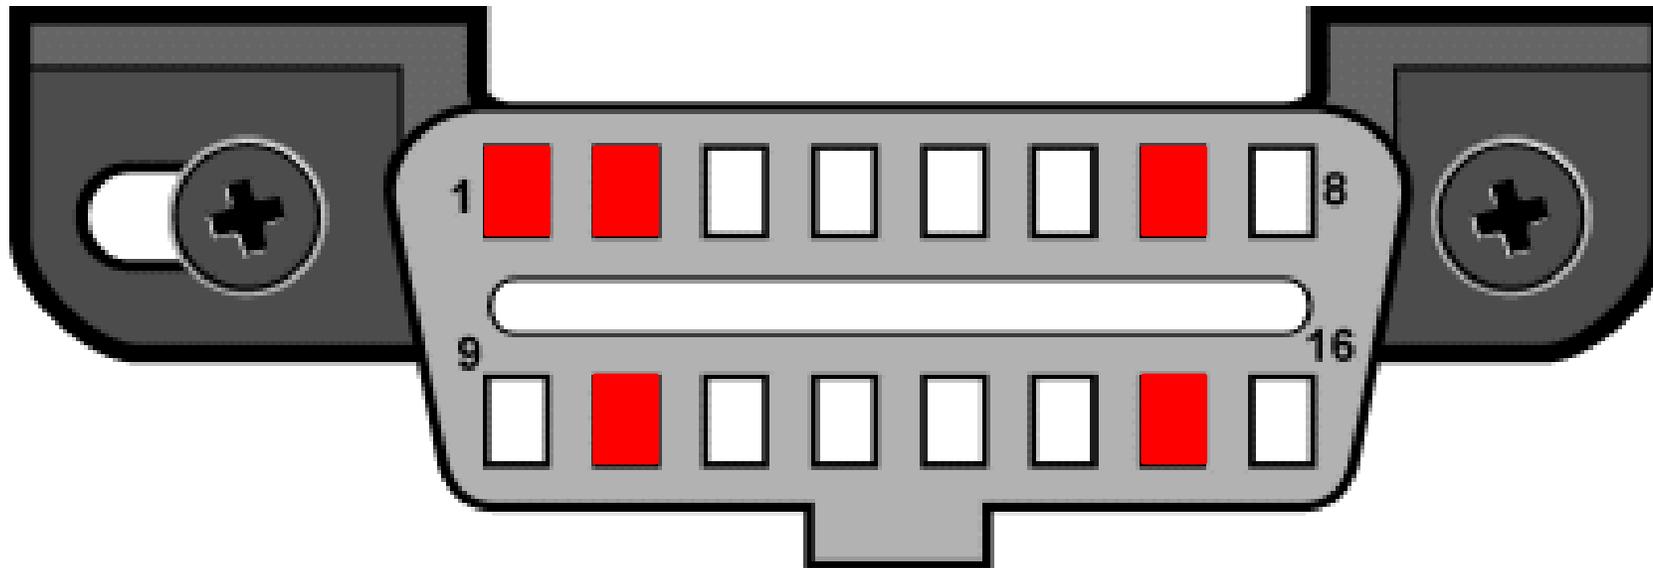

- **Multiple Network Designs**
- **Multiple Network Protocols**
- **Different Diagnostic Paths Depending on Network Design & Protocol**
- **Divide and Conquer is the Most Effective Under Most Failure Types**

Class 2 / SWCAN/ K,L Line

**Class 2 Serial Bus* / PCI Bus – GM, Ford, Stellantis
K, and L Line – Almost all manufacturers (Nissan and VW
most notably to have issues)**

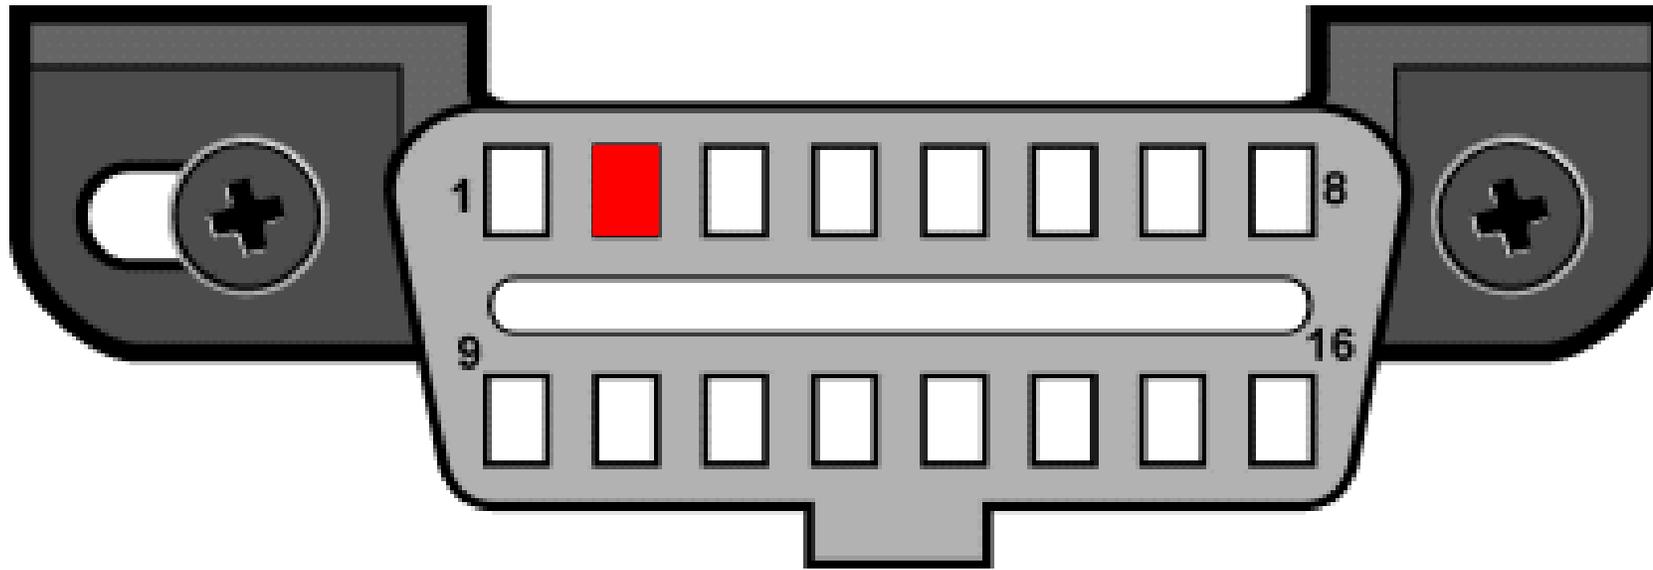

SW CAN – DLC 1 GM (Similar to Class 2), Others

Class 2 Serial BUS / PCI BUS

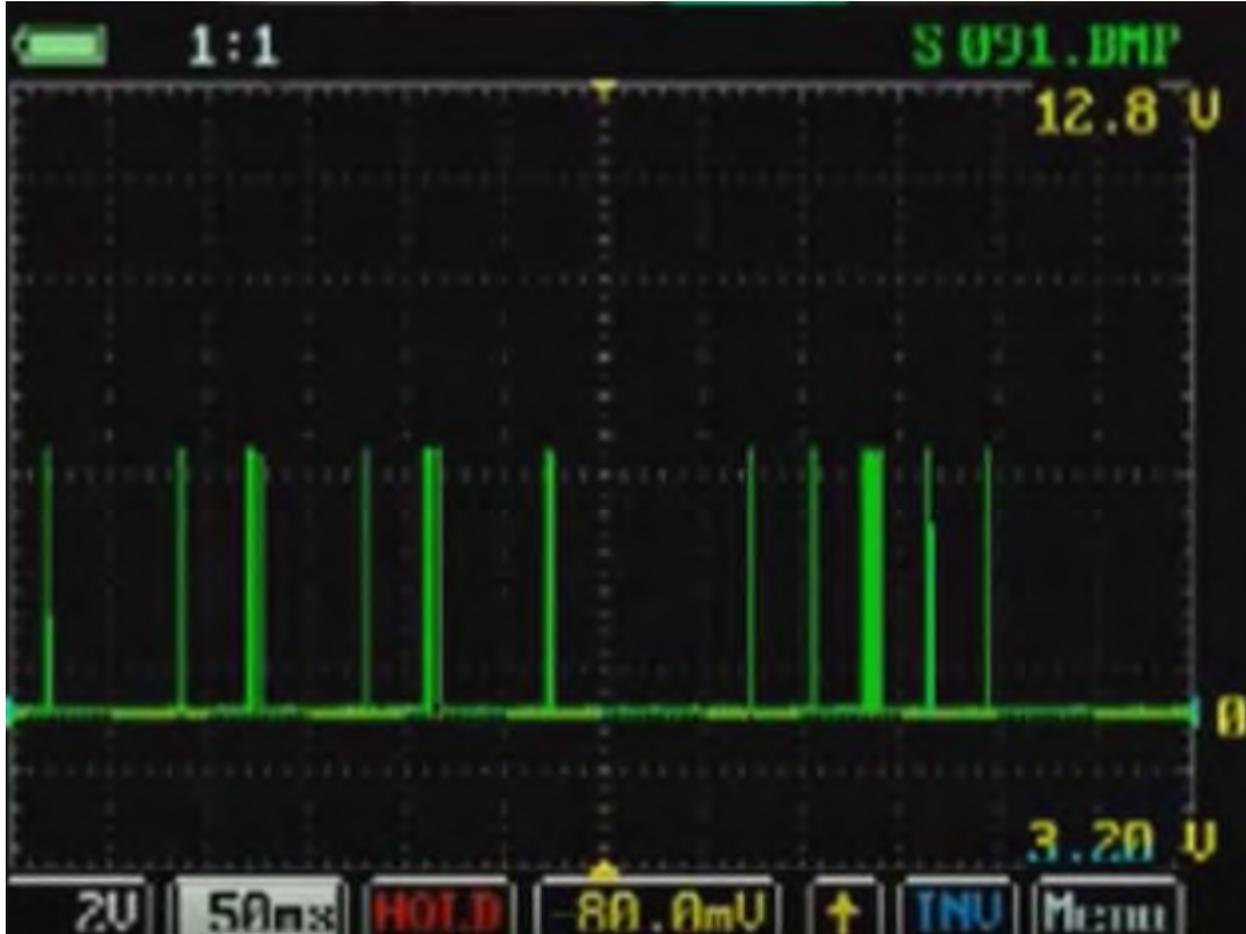

Class 2 Serial Bus* / PCI Bus – GM, Ford, Stellantis

DLC Pin 2*

Class 2 Serial BUS / PCI BUS

Class 2 Serial Bus* / PCI Bus – GM, Stellantis

0 - 7 / 7.5 Vdc Pull Up

Class 2 Serial BUS / PCI BUS

GM and Chrysler Specifically

0 - 7 Vdc Square Wave “Pull Up” Design on GM – “Class 2”

0 - 7.5 Vdc Square Wave “Pull Up” Design on Chrysler – “PCI BUS”

Essentially the voltage on the BUS is at Zero when at rest, and is pulled up to either 7, or 7.5 volts to create transmission of data packets.

J1850 Network Data Packets

Figure 1. Single Byte Header Frame Format

Figure 2. Consolidated One-Byte Header Frame Format

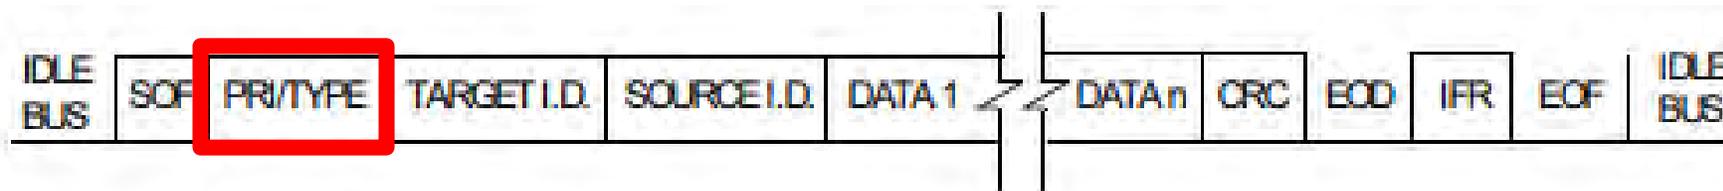

Figure 3. Consolidated Three-Byte Header Frame Format

J1850 Data Differences Breakdown

- **CRC (Cyclic Redundancy Check)** – Similar to Checksum
If the calculated CRC on the receiving side doesn't match the transmitted CRC, the entire message is considered invalid and will be discarded or ignored by the receiving MODULE.
- **PRI (Priority)** – Handled in the standard dominant/recessive type of arbitration bit method we discussed in CAN!
The exact PRI type values (bits) tell receiving ECUs how to treat the message whether to respond, who it's addressed to, and how urgently to process it.

K-LINE OR LIN?

SN65HVDA195-Q1 Automotive LIN and Most ECL Physical Interface

1 Features

- LIN Physical layer specification revision 2.0 compliant and conforms to SAEJ2602 recommended practice for LIN
- LIN Bus speed up to 20-kbps LIN specified maximum and MOST ECL speeds down to 0 Baud
- Supports ISO9141 (k-line)
- Qualified for automotive applications
- Sleep mode: ultra low current consumption, allows wake-up events from LIN bus, wake-up Input (external switch), or host microcontroller
- High-speed receive capable
- ESD protection to ± 12 kV (human body model) on LIN pin
- LIN pin handles voltage from -40 V to 40 V
- Survives transient damage in automotive environment (ISO 7637)
- Extended operation with supply from 7 V to 27 V DC (LIN specification 7 V to 18 V)
- Interfaces to microcontroller with 5-V or 3.3-V I/O pins
- Wake-up request on RXD pin
- Control of external voltage regulator (INH pin)
- Integrated pullup resistor and series diode for LIN responder applications
- Low electromagnetic emission (EME), high electromagnetic immunity (EMI)

3 Description

The SN65HVDA195 device is the Local Interconnect Network (LIN) physical interface and MOST ECL interface, which integrates the serial transceiver with wake-up and protection features. The bus is a single-wire bidirectional bus typically used for low-speed in-vehicle networks using data rates to 20 kbps. The device can transmit with an effective data rate of 0 kbps because it does not have dominant state time-out. The protocol output data stream on TXD is converted by the SN65HVDA195 into the bus signal through a current-limited wave-shaping driver as outlined by the LIN physical layer specification revision 2.0. The receiver converts the data stream from the bus and outputs the data stream through RXD. The bus has two states: dominant state (voltage near ground) and the recessive state (voltage near battery). In the recessive state, the bus is pulled high by the SN65HVDA195 internal pullup resistor and series diode, so no external pullup components are required for responder applications. Commander applications require an external pullup resistor (1 k Ω) plus a series diode per the LIN specification.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	BODY SIZE (NOM)
SN65HVDA195-Q1	SOIC (8)	4.90 mm \times 3.91 mm

LIN BUS

Local Interface Network

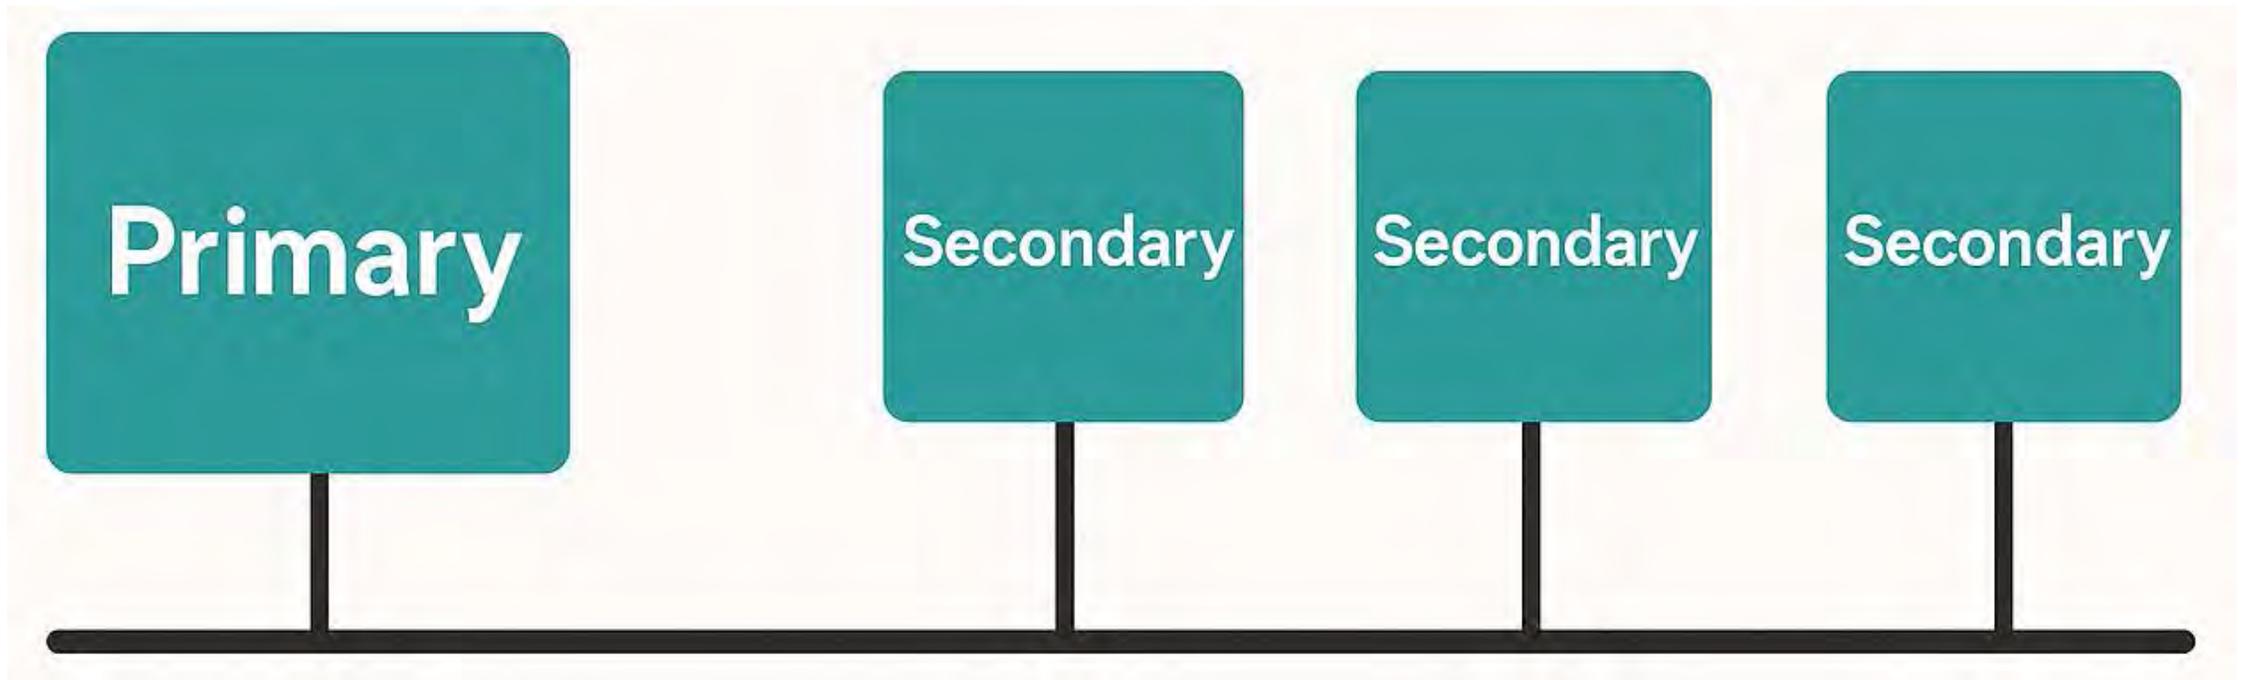

LIN BUS networks are very similar to the other single wire networks, with the exception that they are not wired to the DLC.

These networks utilize a Primary module, each Secondary module is wired to the Primary on the LIN BUS, the LIN BUS does not lead back to the DLC at all.

The Secondary modules on the BUS typically can not communicate directly with the scan tool.

LIN Bus

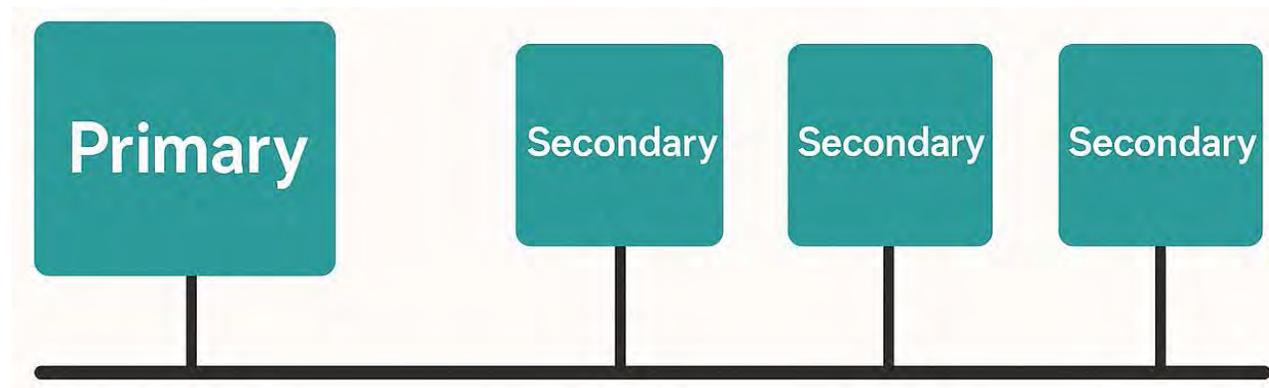

Another type of single wire network that will be discussed is a LIN bus.

LIN Bus In a Nutshell!

LIN is a low-cost, single-wire, Primary/Secondary network used for non-critical communication in vehicles.

- Speed: Up to **20 kbps**
- Topology: **1 master + up to 15 slaves**
- Medium: **Single wire + ground**
- No arbitration → master controls all timing

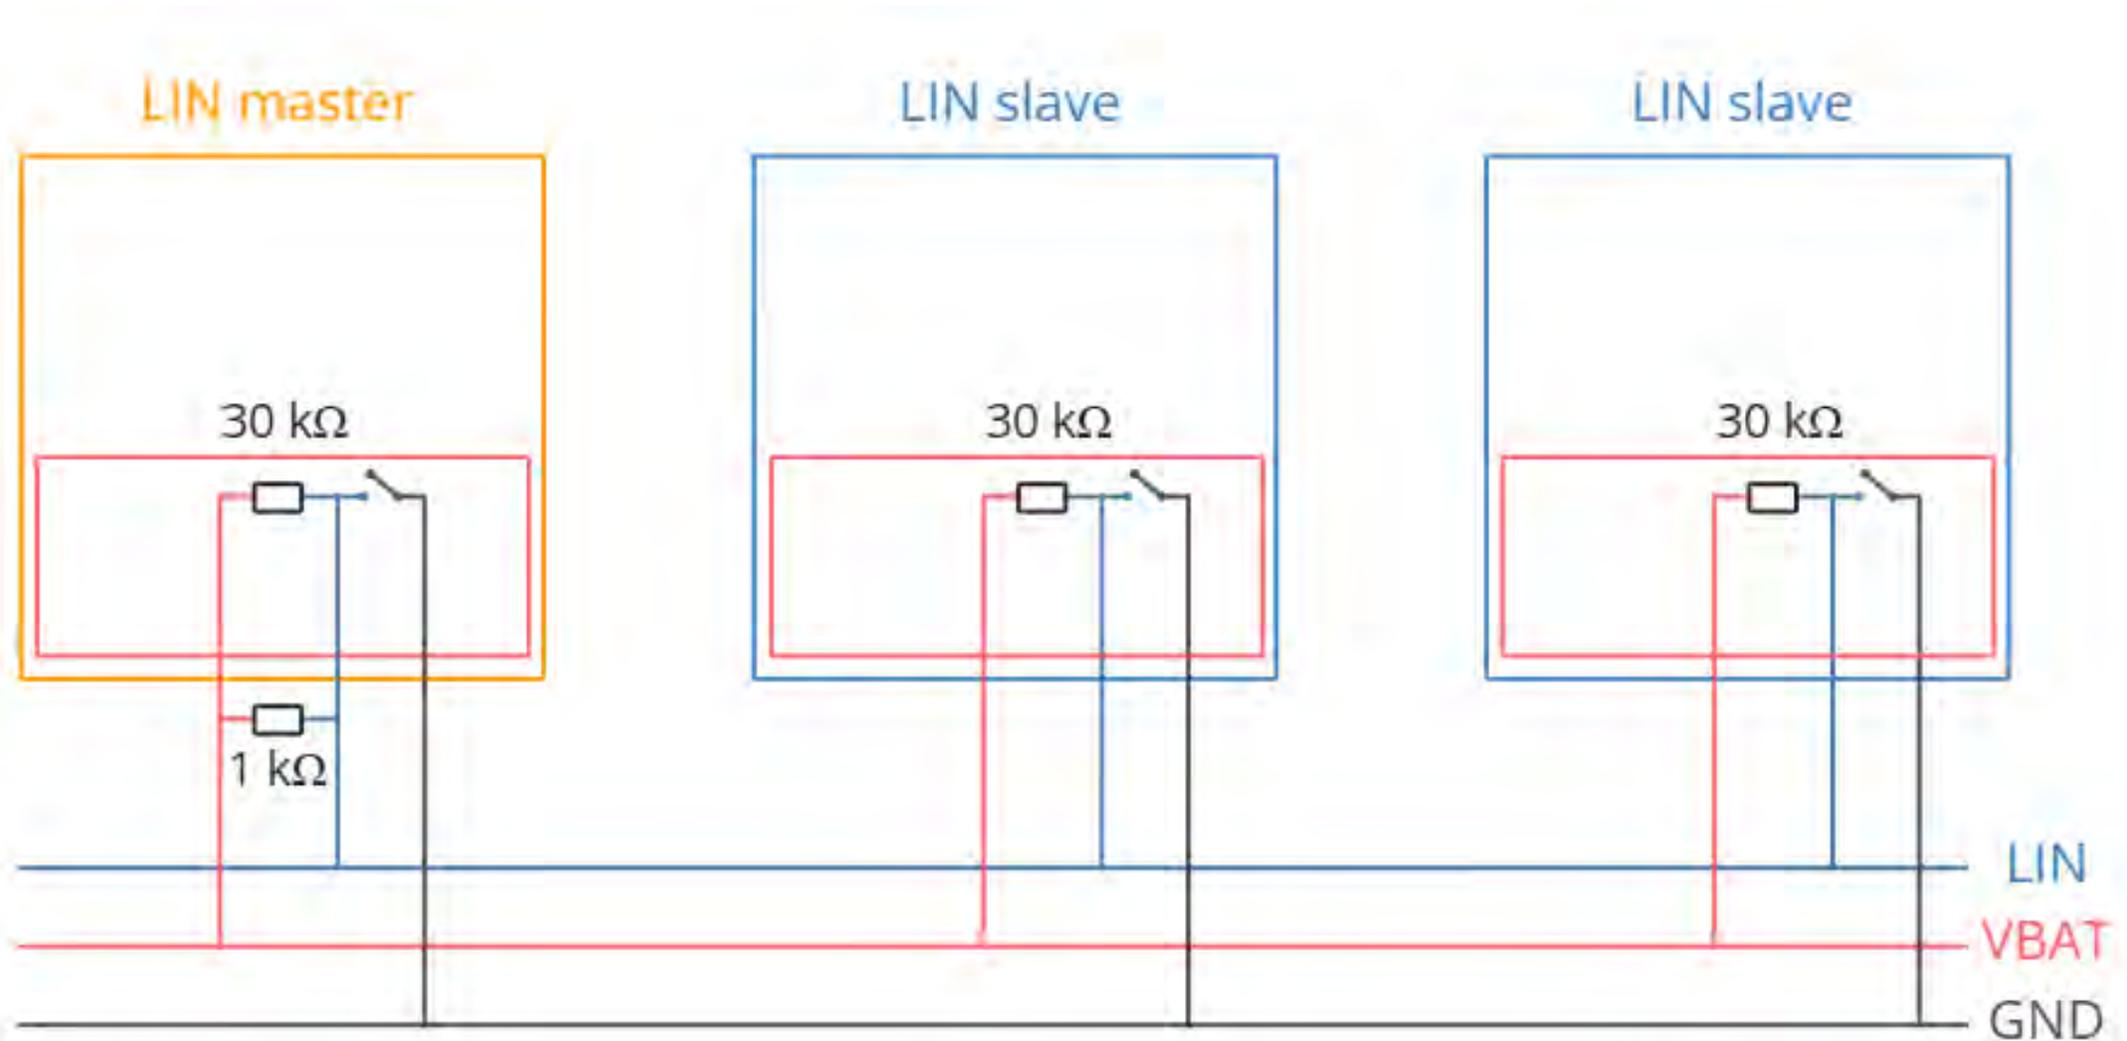

What is in a Message?

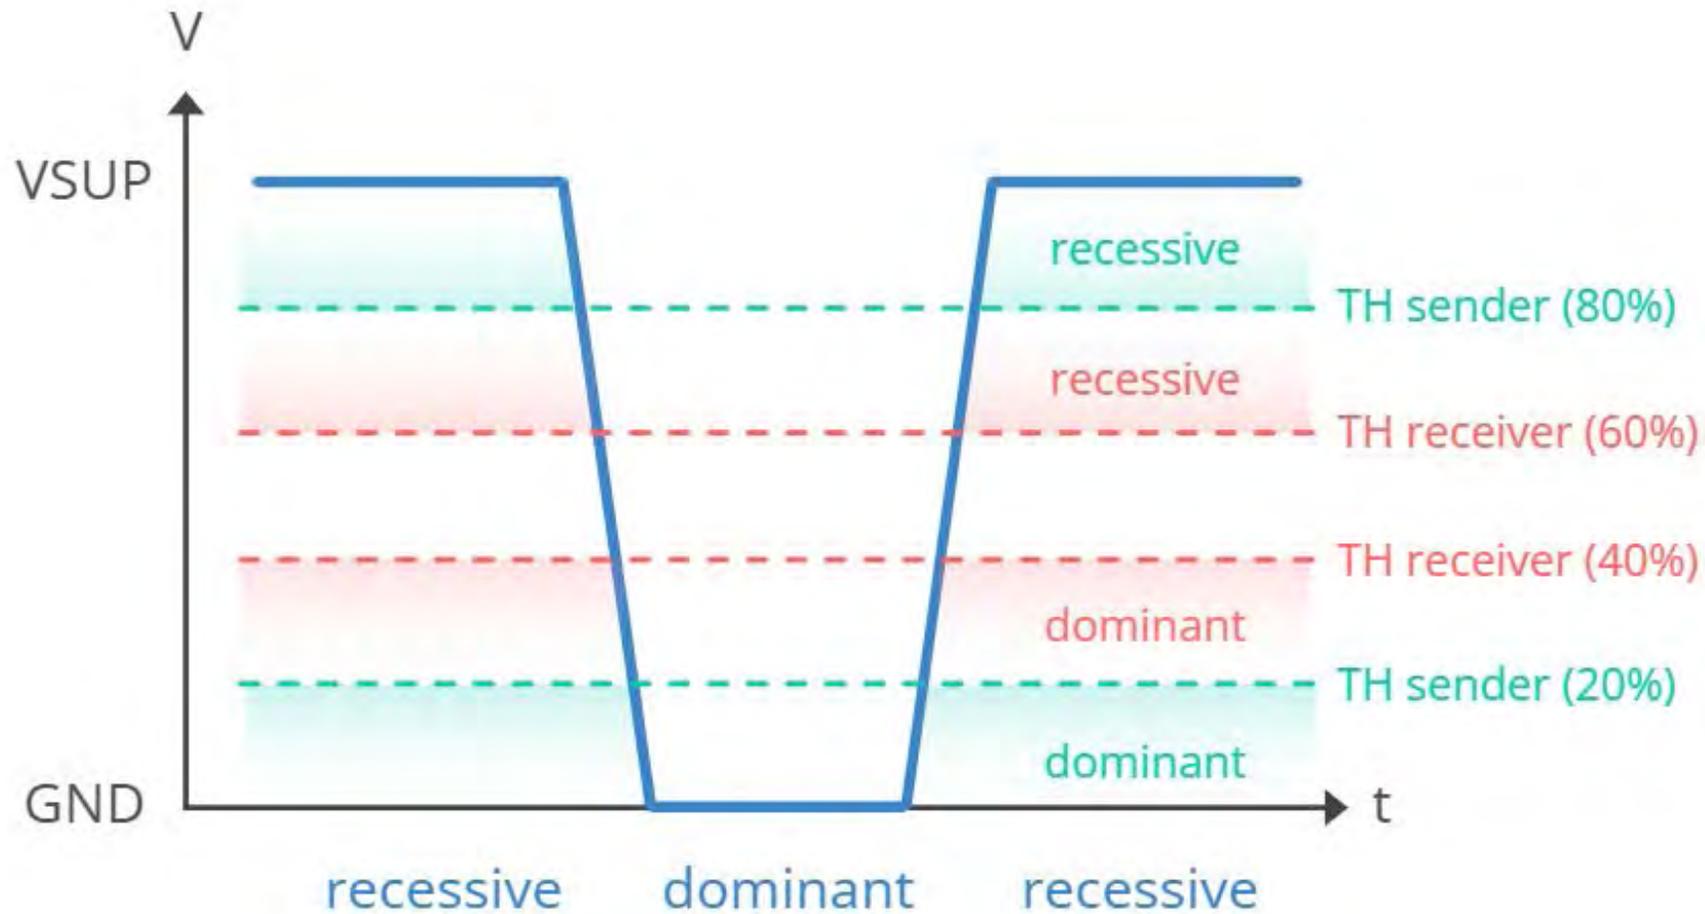

LIN TP frame types (LIN Bus Transport Protocol, ISO 17987-2)

Common LIN Network Architectures

LIN Bus Function

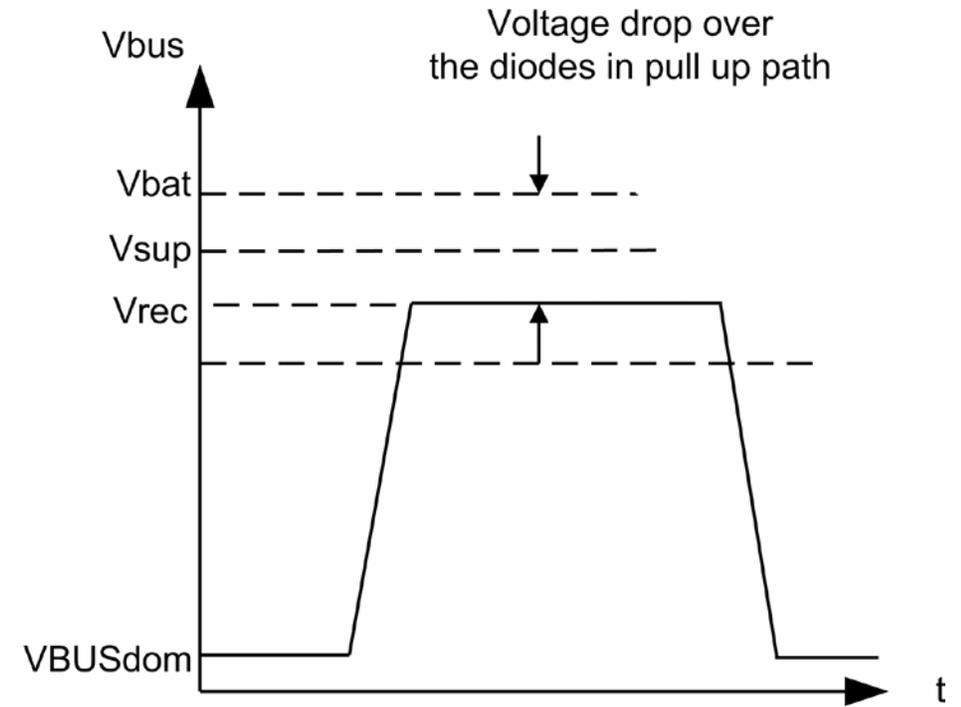

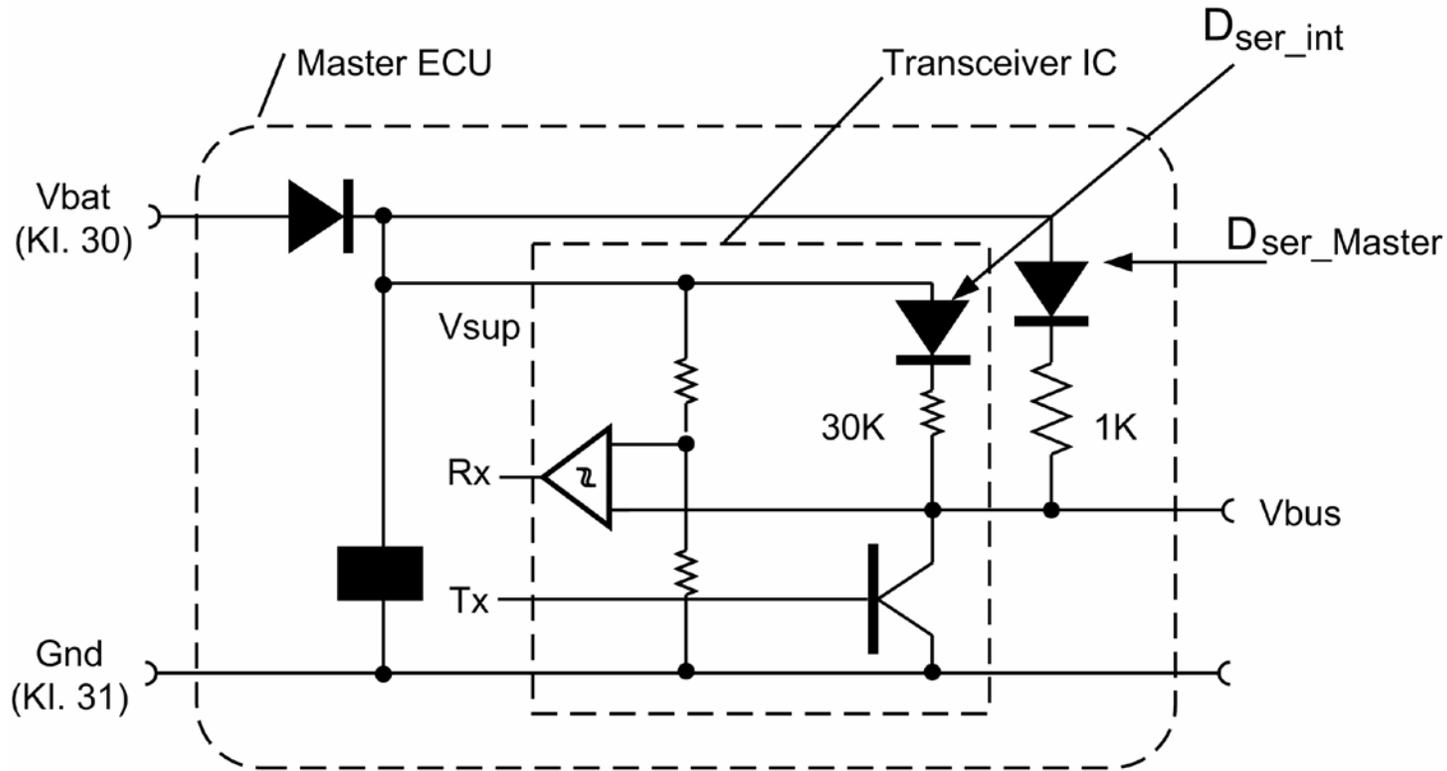

Enables bit wise communication by switching the single wire LIN bus from:

high (recessive, logic 1)

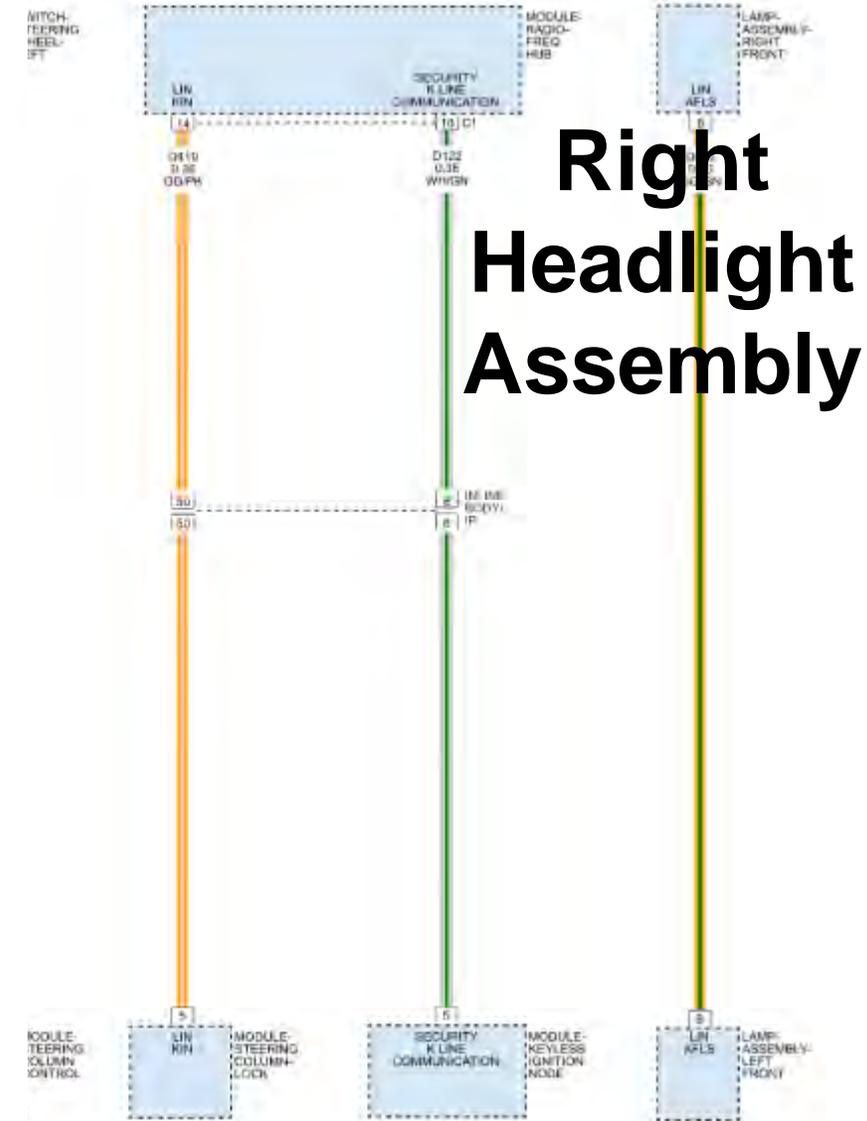

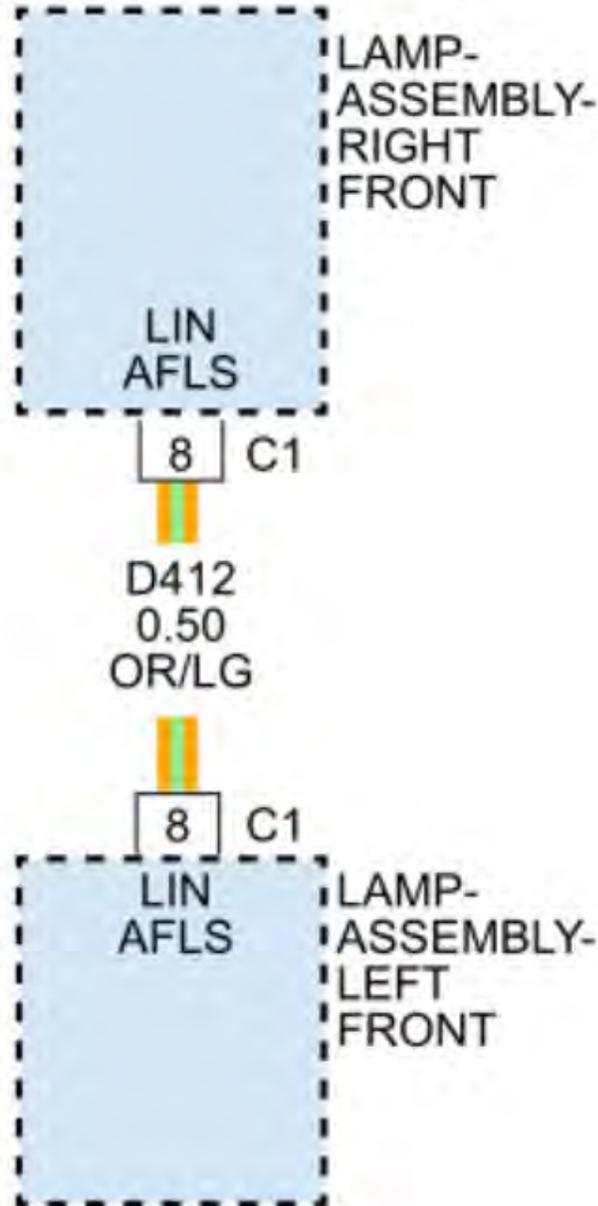

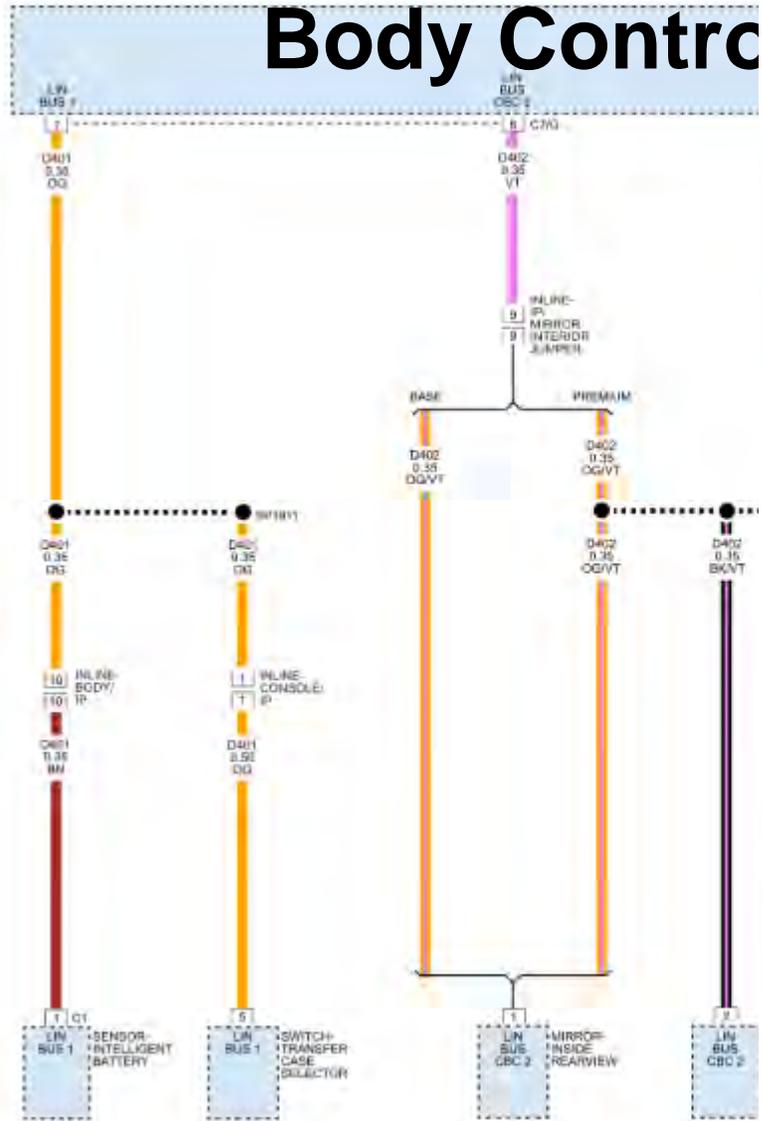

To

low (dominant, logic 0)

What Makes that Message Happen?

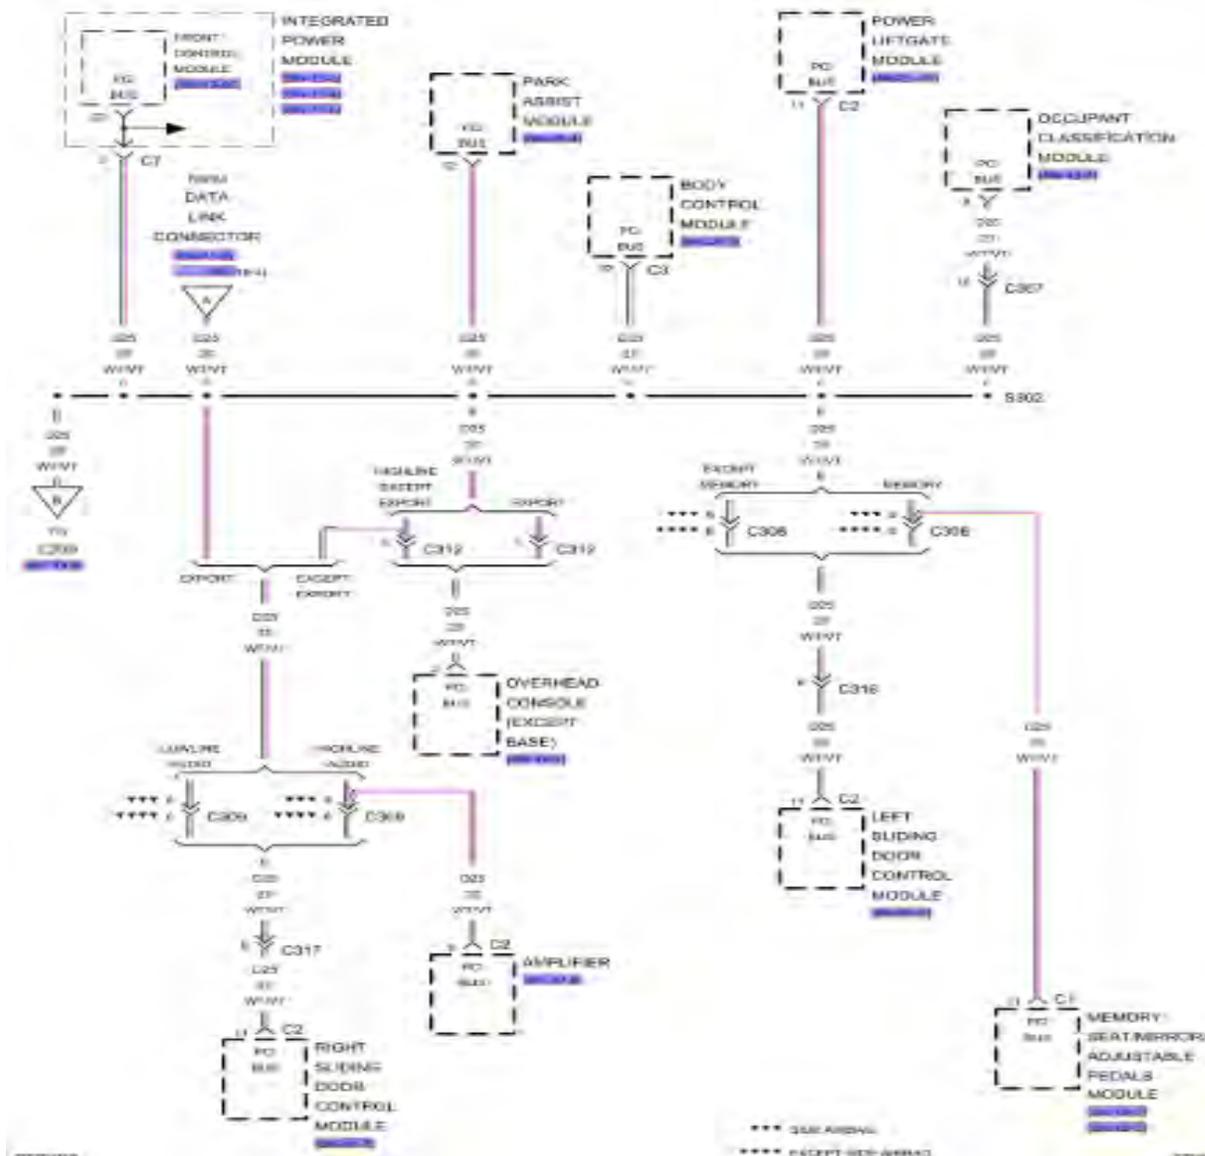

LIN BUS

Class 2 / SW-CAN / PCI BUS

**This method applies
to ALL 3 types of
networks.**

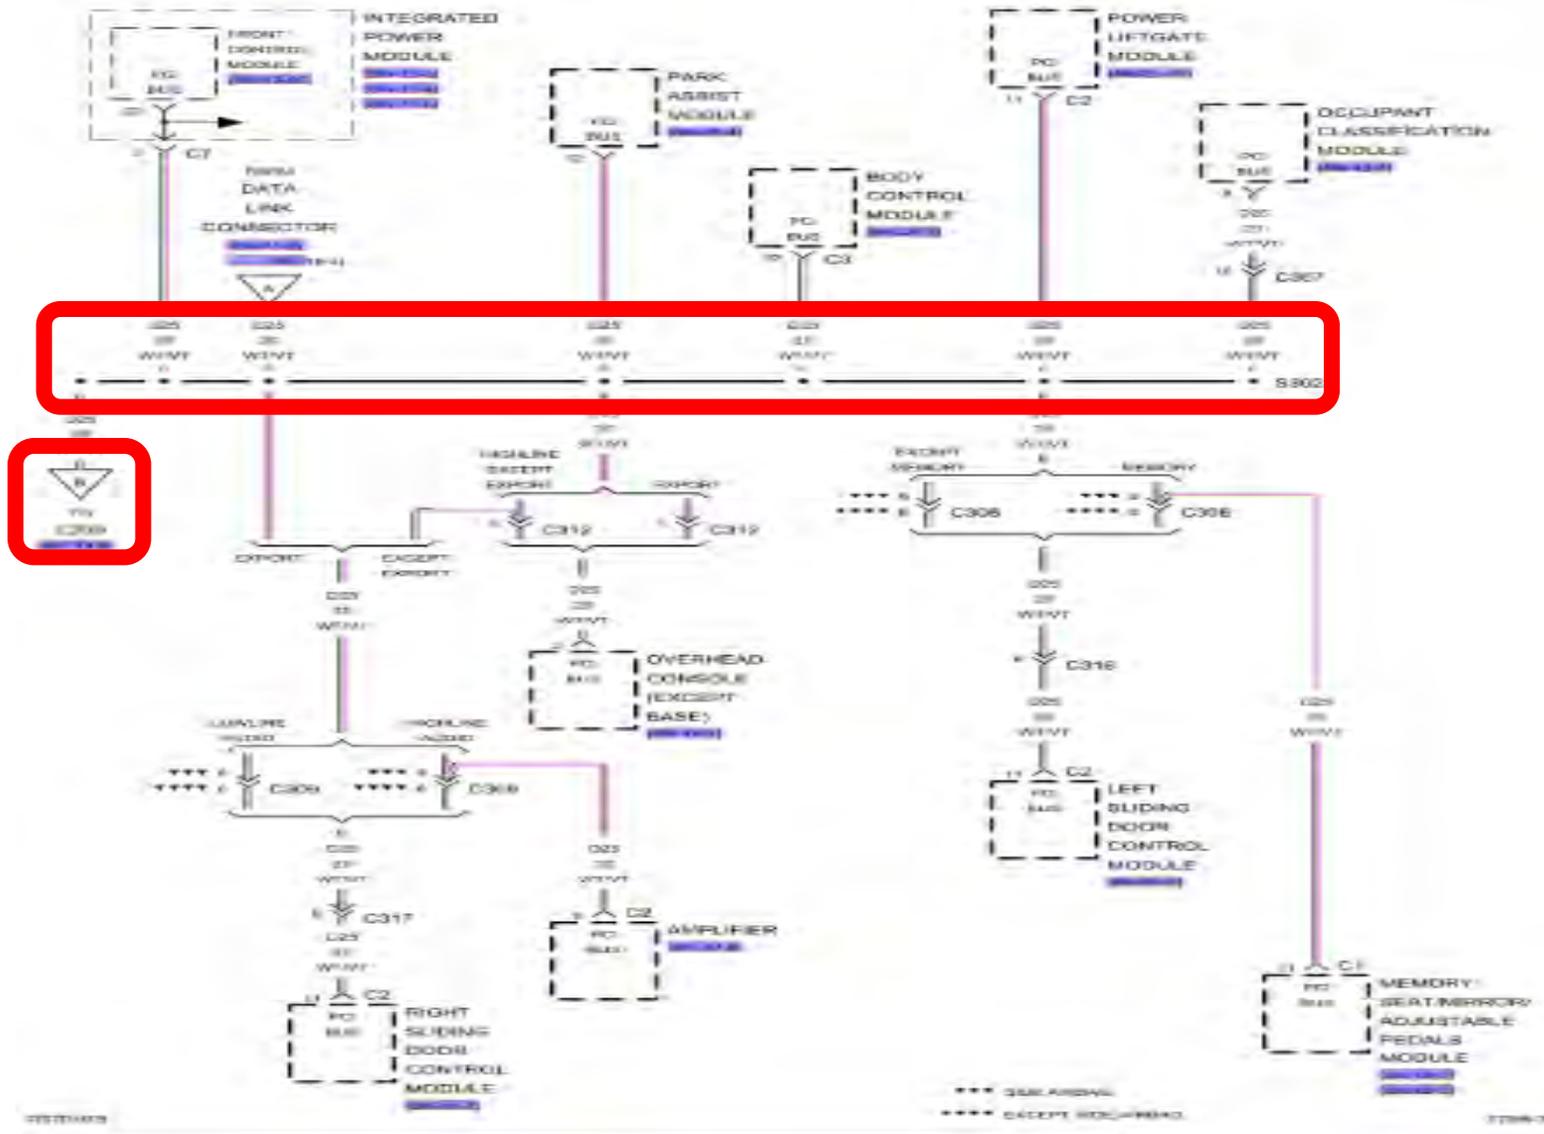

Class 2 / SW-CAN / PCI BUS

- Review [Strategy Based Diagnosis](#) for an overview of the diagnostic approach.
- [Diagnostic Procedure Instructions](#) provides an overview of each diagnostic category.

DTC Descriptor

For device DTC descriptors, refer to [Control Module U Code List](#) .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1500-U15BF	U1500-U15BF	—	—
Ignition	U1500-U15BF	U1500-U15BF	—	—
LIN Serial Data	U1500-U15BF	U1500-U15BF	U1500-U15BF	—
Ground	—	U1500-U15BF	—	—

Circuit/System Description

The Local Interconnect Network (LIN) Bus consists of a single wire with a transmission rate of 10.417 Kbit/s. The serial data is transmitted over a LIN circuit between a master control module and other LIN devices within a particular subsystem. If serial data communication is lost between any of the LIN devices on the LIN bus network, the master control module will set a no communication code against the non-communicating LIN device.

Conditions for Running the DTC

The system voltage is between 9–16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Although BMW codes can be cryptic, service information is on the factory scan tool as a guided fault function, or through AOS.

We can see that by the Codes in the FRM (Footwell Module) we have Comm issues (9XXX Codes) with the headlight motors.

Bi-directional controls fail!

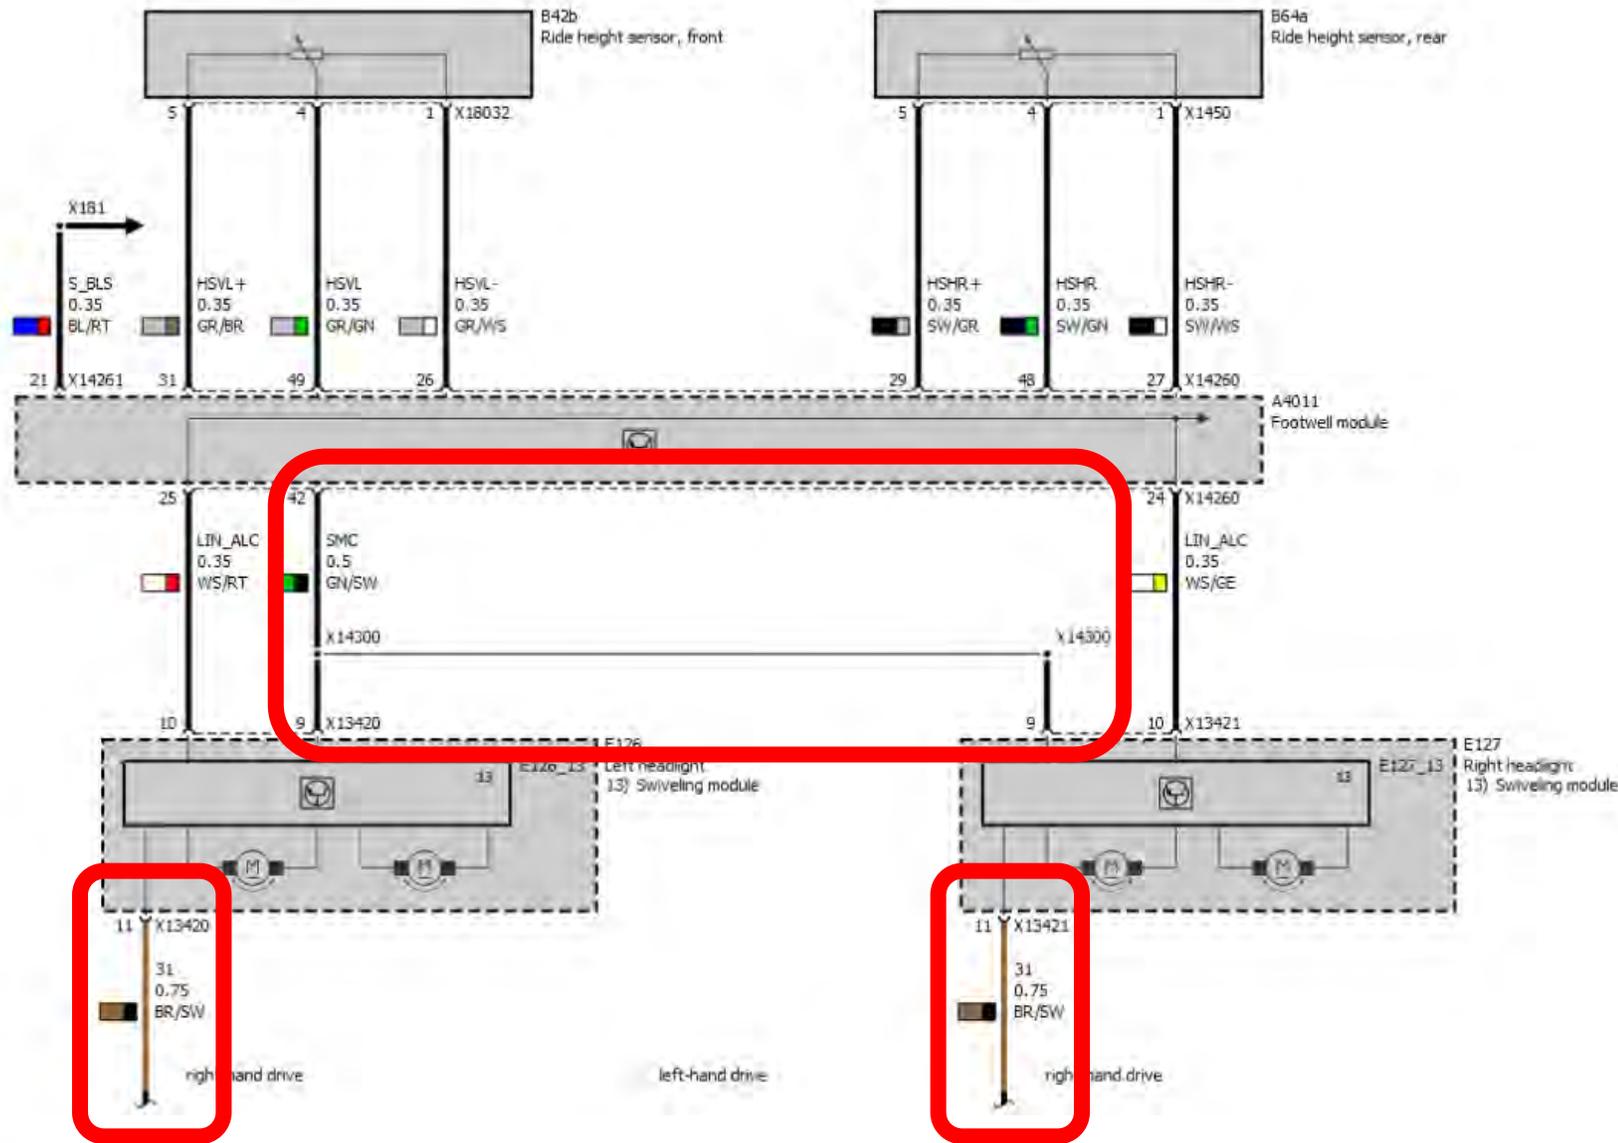

LIN BUS – CASE STUDY 2

Looking at the wiring diagram we quickly find that this “complicated” German engineered car still has simple LIN bus modules.

Testing them is the same..... with a twist!

LIN BUS – CASE STUDY 2

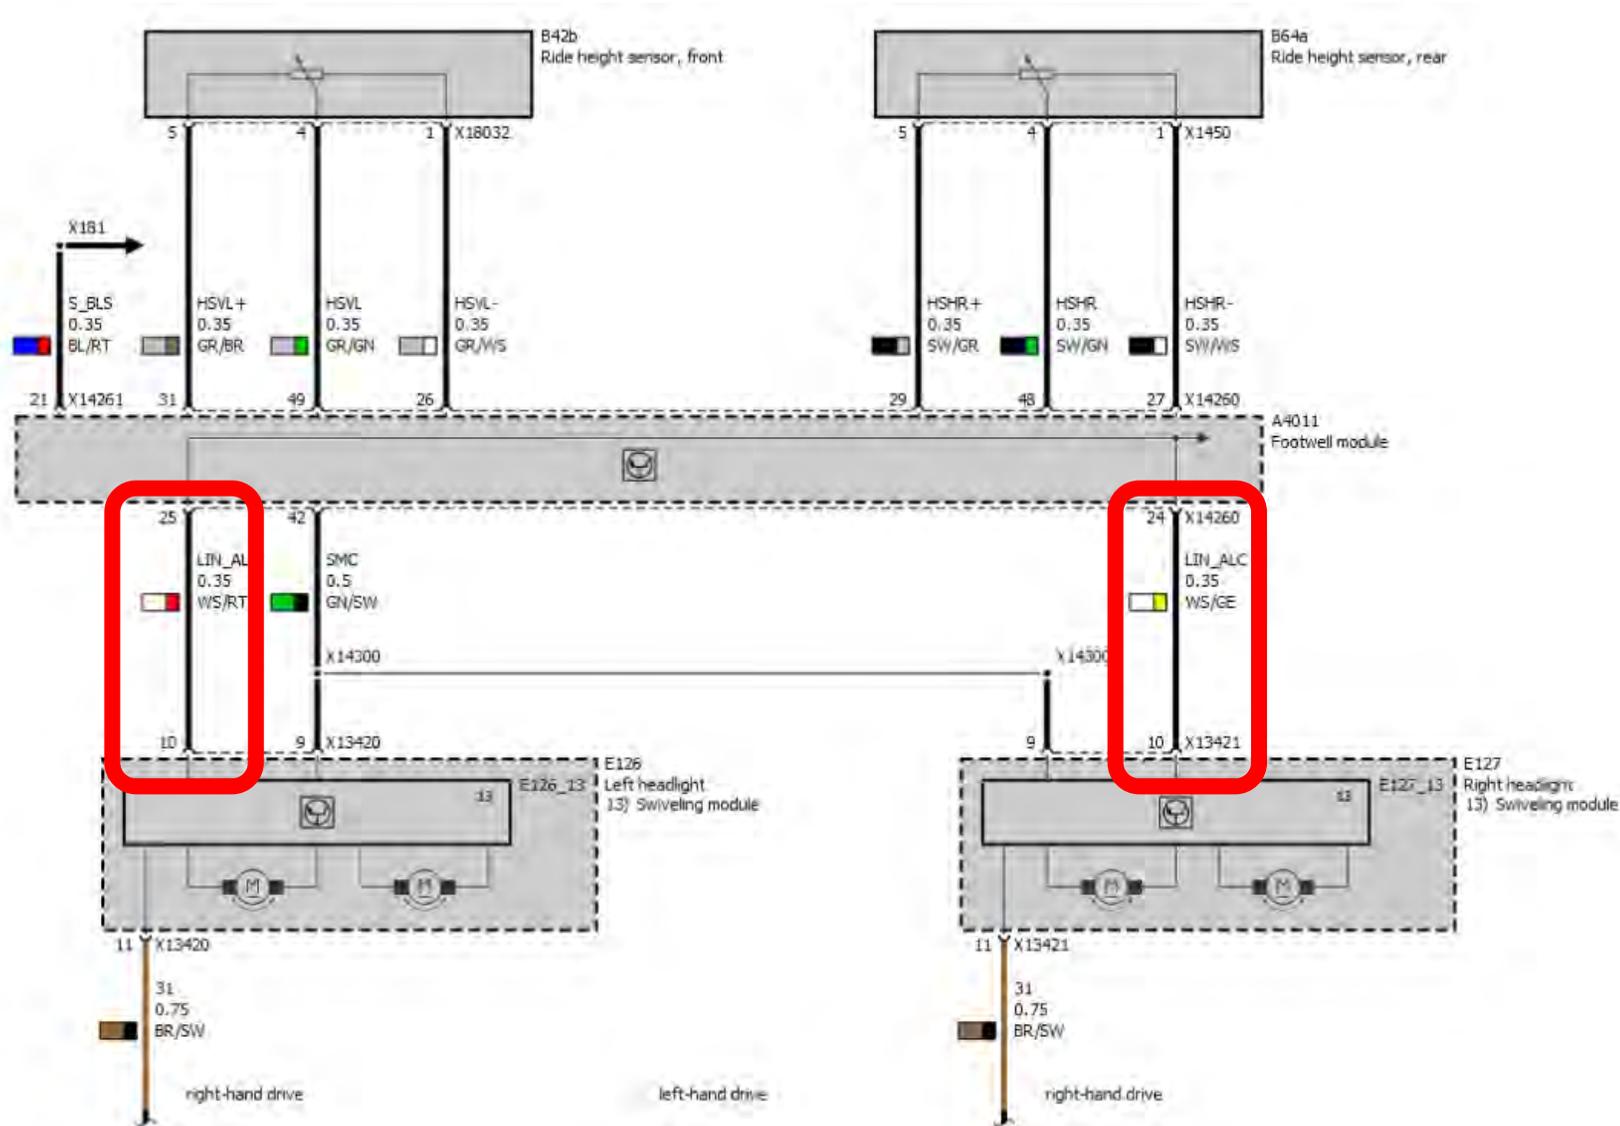

Our initial testing is within our normal testing path!

Test the module powers.

Test the module grounds.

Now for the Communications!

LIN BUS – CASE STUDY 2

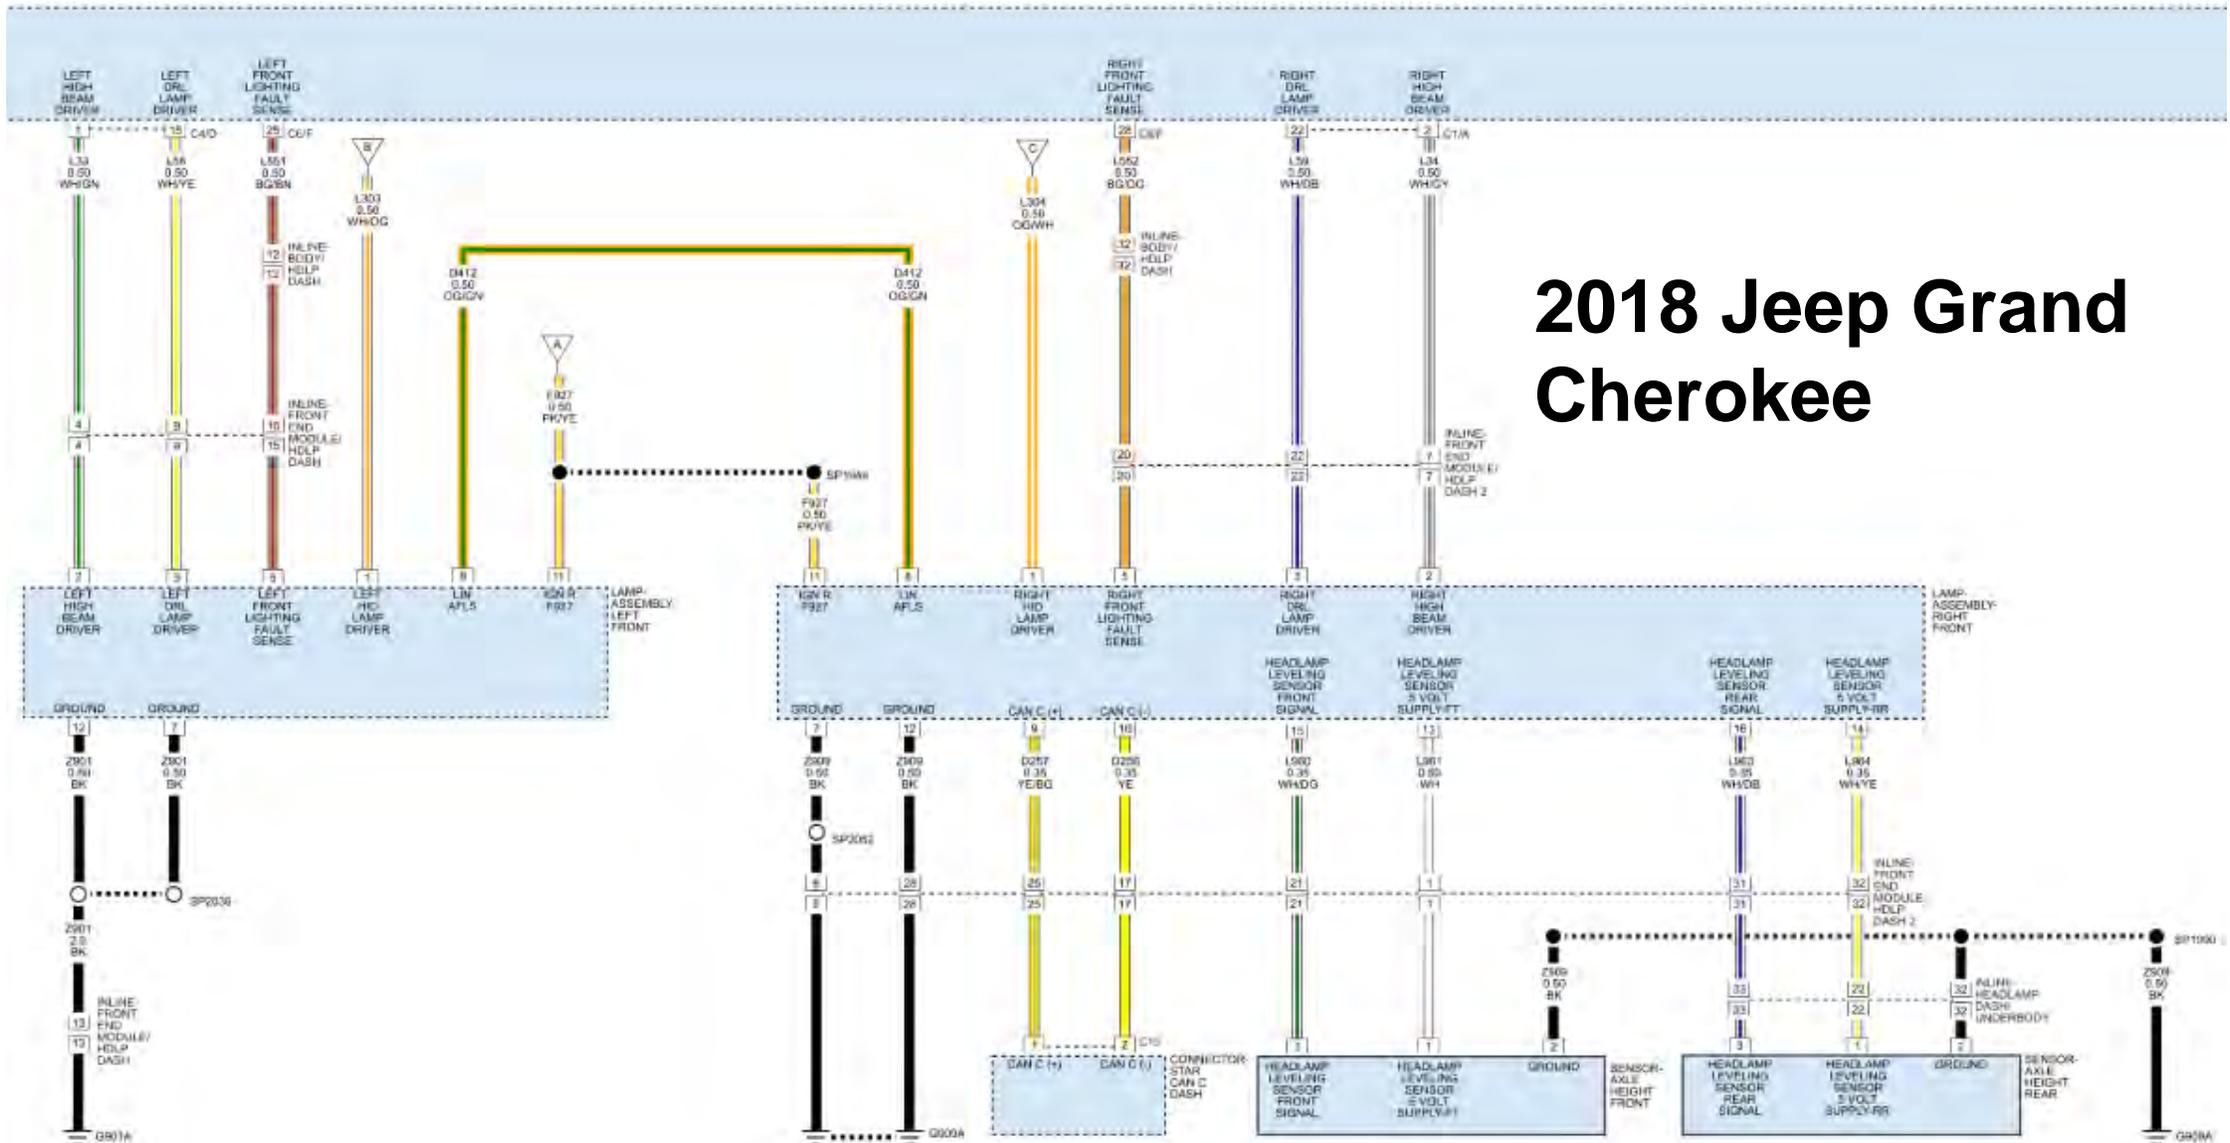

**This car got me.
Well mostly!**

**There was a twist
to my diagnosis.**

**I pulled each
connector, and
found good comm
signal from the
FRM...**

OTHER LIN BUS VARIANTS

2018 Jeep Grand Cherokee

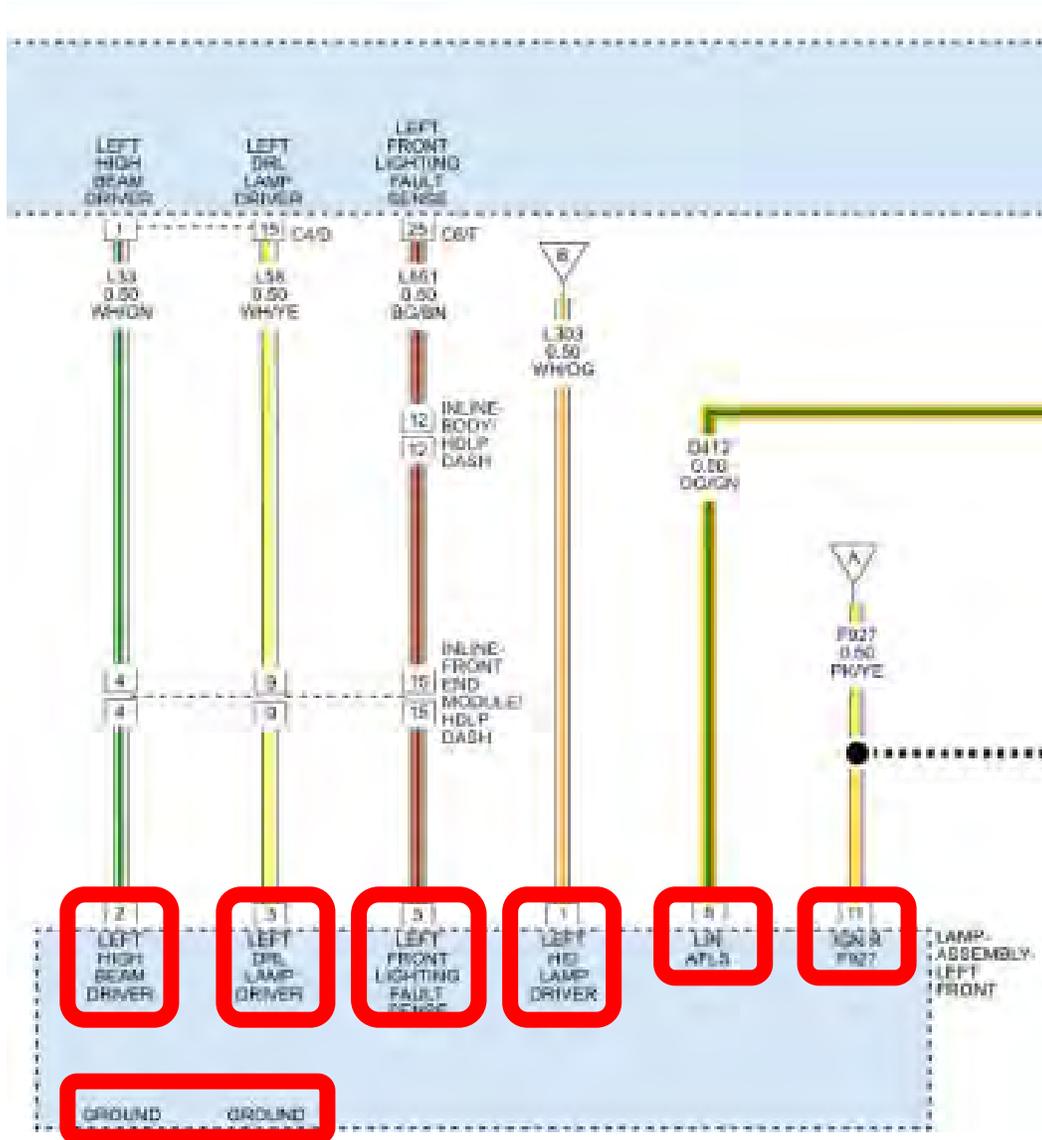

2018 Jeep Grand Cherokee

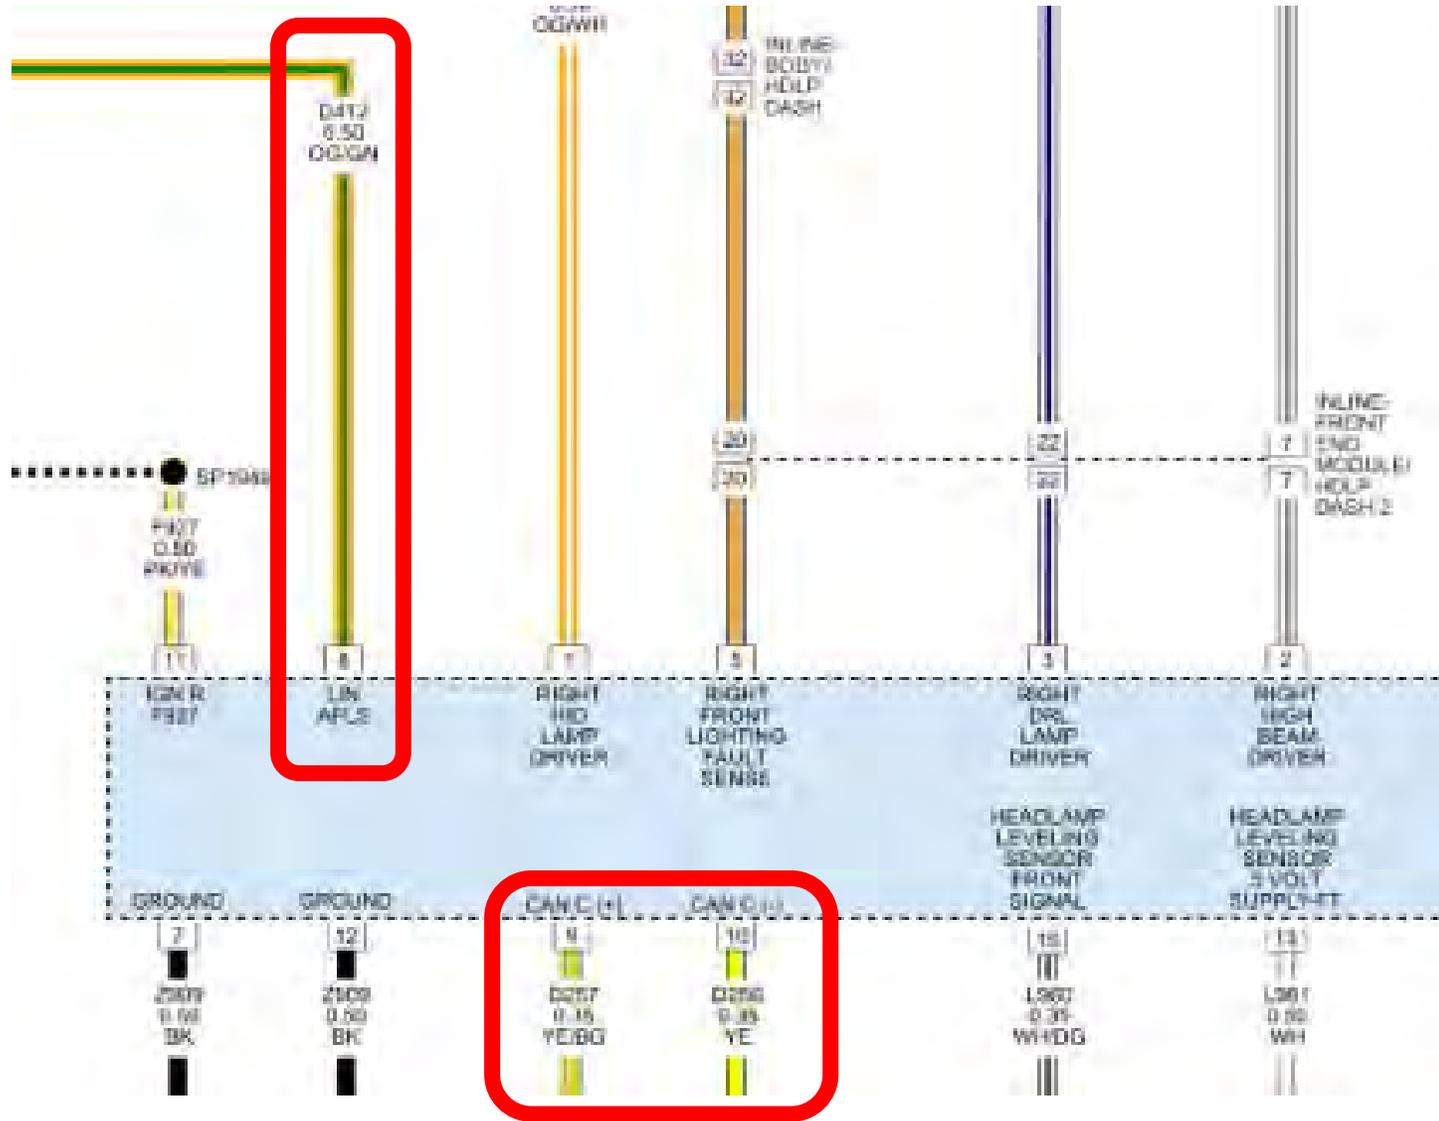

The left headlamp assembly has:

High Beam Driver
Driving Lamp Driver
A Fault Sense Wire
An HID Driver
Ignition B+ Feed
2 Grounds

And a LIN Wire.... But where does it go?

2018 Jeep Grand Cherokee

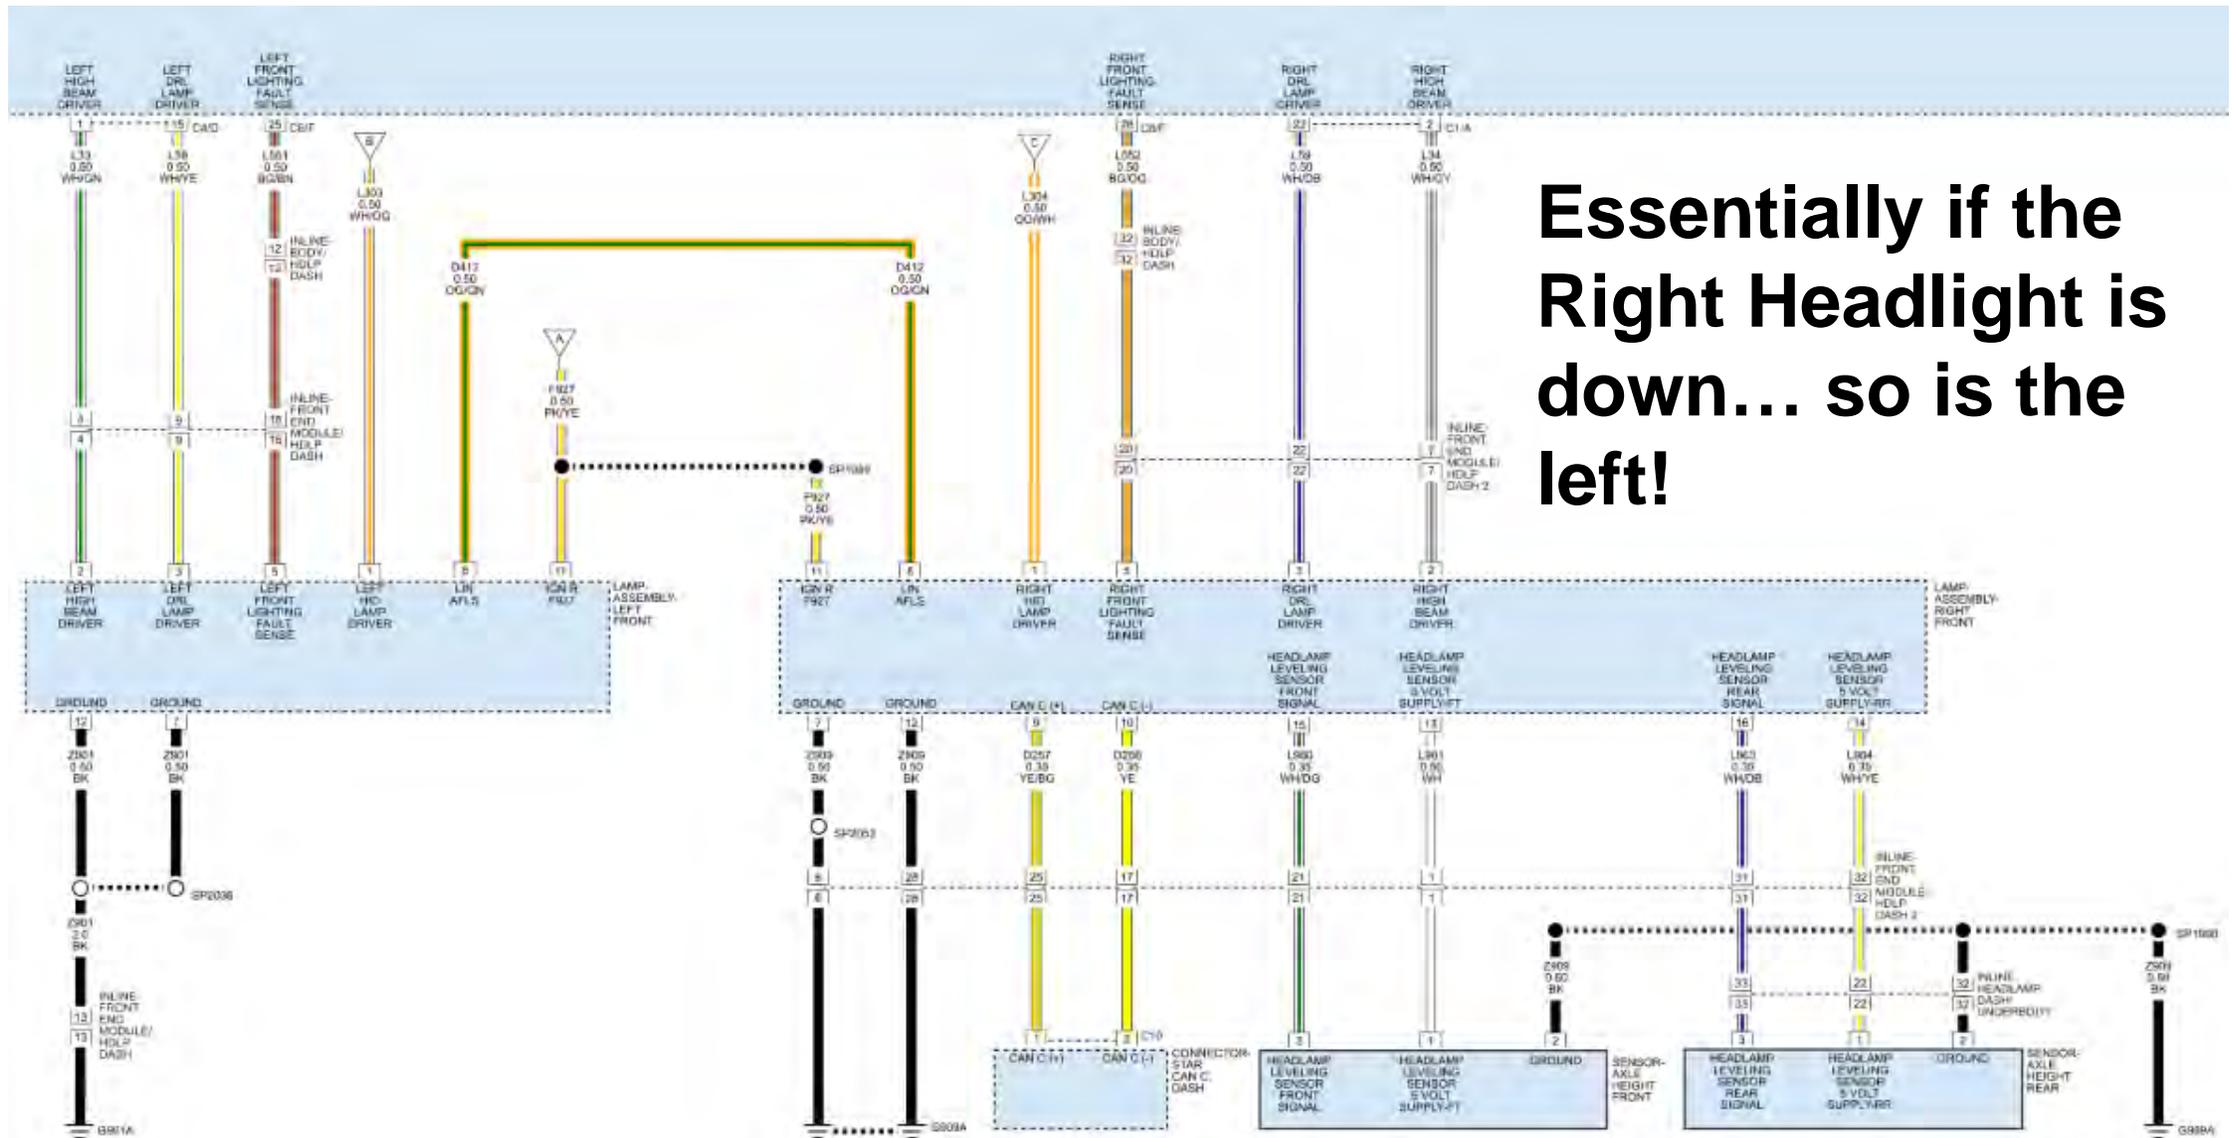

To the Right Headlight!

The Right Headlight Is More Than the Other LIN BUS Module...

It's the PRIMARY Module for the Headlight LIN BUS, it has the connection to the rest of the CAN BUS.

2018 Jeep Grand Cherokee

Essentially if the Right Headlight is down... so is the left!

2020 Ford Escape

Customers Complaint

Daniel states that the vehicle displays a battery/charging system warning light after approximately 10 minutes of driving, consistently occurring without fail.

The dealership has previously inspected the alternator and battery and found no issues, including tightening the alternator connection, but the warning light continues to appear. Despite their inability to resolve the issue, the dealership speculated that rodent damage might be a factor, although no evidence was found. Subsequently, a "battery low" warning illuminated on the instrument cluster.

Daniel mentions there have been no problems starting the vehicle, and it is driven daily by his son, who drove it in today. His son will be leaving for college with the vehicle next week. Before addressing any other concerns, please inspect the vehicle for signs of rodent damage. Please have a diagnostic specialist perform analysis and testing for this concern.

Most Bus

MOST (Media Oriented Systems Transport) is a high-speed multimedia network used in vehicles to transmit **audio, video, voice, and control data** between infotainment components.

Basic Operational Flow Continuous Data Stream:

- A master node generates a **clock-synchronous frame stream**.
- This stream loops continuously around the ring.
- All nodes receive the same stream at the same time.

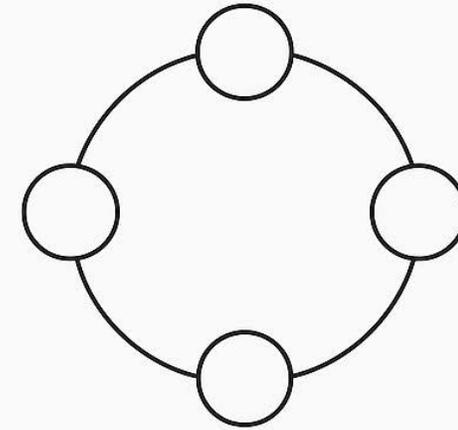

Common MOST Network Architectures

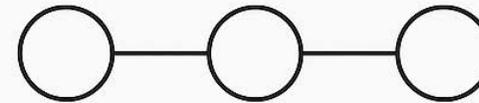

Ring Topology - A closed-loop structure where each node forwards data to the next; failure in one node or connection typically breaks the entire system unless redundancy is built in.

Daisy Chain Topology - A linear series of nodes where each device is connected to the next in sequence; simpler and cheaper but lacks fault tolerance — a break disconnects all downstream nodes.

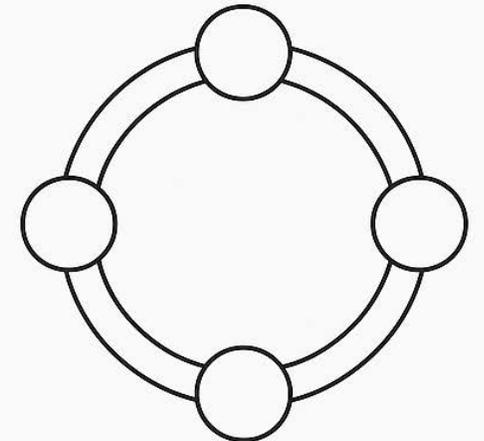

Dual Ring Topology - A redundant ring with two parallel loops (primary and secondary) allowing data to reroute in case of a failure, providing high reliability and continuity in critical systems.

Ring Topology

Daisy Chain
Topology

Dual Ring Topology

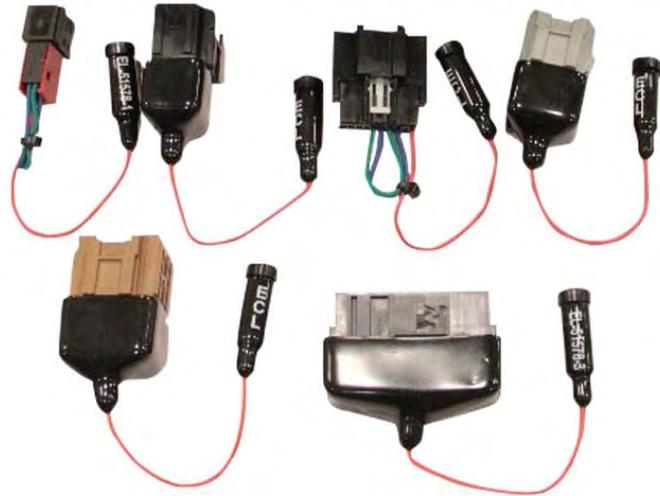

MOST Network Basics

Generation	Medium	Speed
MOST25	Plastic Optical Fiber (POF)	25 Mbps
MOST50	Dual POF or coax	50 Mbps
MOST150	Coax, UTP, or POF	150 Mbps

Failure in any node **USUALLY** can break the ring.

Requires specialized loopback tools for testing by isolation.

MOST Bus Specific Tools

Mini-B

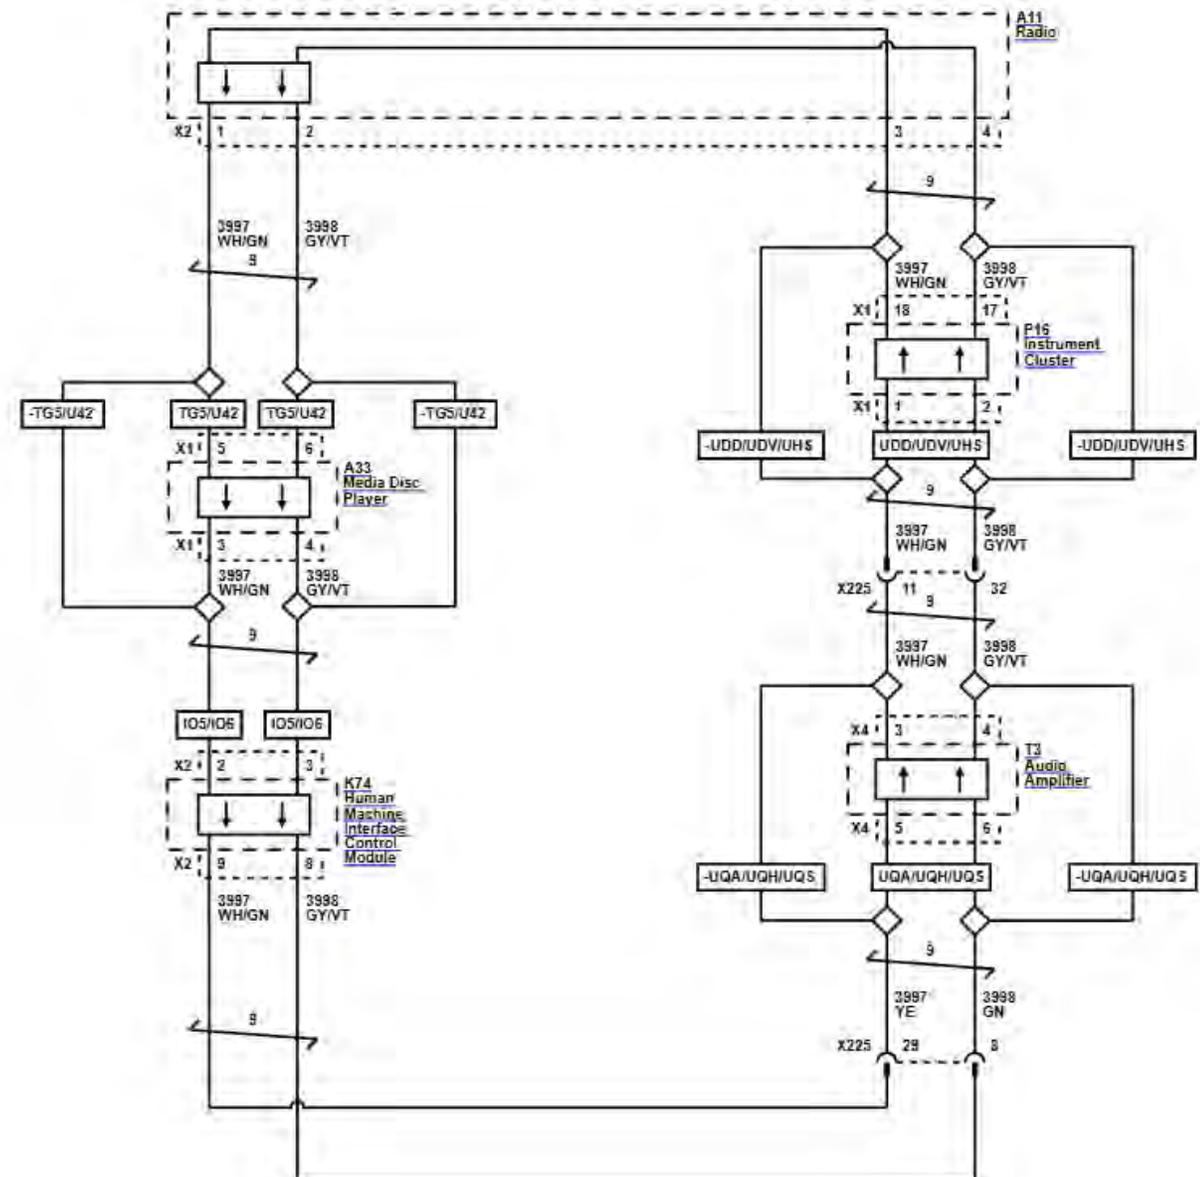

MOST Bus Architecture Premises

- MOST is a clock-synchronized ring network, not event-based like CAN.**
- Every node receives and forwards the same data stream — no arbitration.**
- This architecture allows zero-jitter audio/video streaming, but it's fragile: one broken node or fiber can take down the entire bus unless redundancy is added.**

2020 Suburban – Radio Screen Blank

2020 Chevrolet Suburban 1GN5CGKC0LR187070

“The radio screen is just black & it was replaced last week, and everything was working when they installed it. The vehicle sat over the weekend and now the screen is on, but the buttons are not working.” – Tech Notes

2020 Chevrolet Suburban – Pre-Scan

Techline Connect 2.3.6 Production OCF

Control Module	Type	DTC	Symptom Byte	Description

GDS 2 v.22.8.00900 GM Global v2025.03.10 VIN: 1GN5GK0LR187070 2020,Chevrolet,Suburban,Vehicle Diagnostics MDI 2: 88971698 12.5 V

2020 Suburban – DTC Set Criteria

- **U0028:00** - Can be almost any fault!
- The radio is the MOST “**Diagnostic Master**” and is default “**Node 1**”
- Each device provides 12v on the MOST control circuit. The Radio will pull the 12v to 0v for 100ms to signal all Nodes to “**wake-up**”.
- When the “**MOST ring**” is incomplete the Radio will send a 0v pull down “**Wake-Up message**” every 2.5 seconds and the U0028 sets.
- The data stream will identify all talking nodes.

DTC **U0028**

2020 Suburban – Scan data PIDS

- **Number of Most breaks** is the amount of time the Radio has sent a **wake-up** without receiving it back.
- **Last working MOST ID of node 1** will show the first module in the ring that **communicates** back to the Radio.
- This pattern continues down the line for each node position. Typically, this is your direct view into your test plan.

Items selected	Name	Value
Surround sound		Off
Surrogate MOST master node upstream position		None
Number of MOST communication breaks		30
Last working MOST ID of node 1		Radio
Last working MOST ID of node 2		UNRECOGNIZED STATE
Last working MOST ID of node 3		UNRECOGNIZED STATE
Last working MOST ID of node 4		UNRECOGNIZED STATE
Last working MOST ID of node 5		UNRECOGNIZED STATE

2020 Suburban – Diagram & Test Plan

2020 Suburban – What does the data suggest?

2012 Land Rover Range Rover

Customer states most of the electronics on dash are inoperative. Please diagnose and advise.

PAM – Parking
Aid Module

AAM - Audio
Amplifier Module

The screenshot displays the 'Vehicle Specification' section of a diagnostic tool. It shows a grid of modules categorized by CAN bus (CAN_HS, CAN_MS, SUB_MOST). The PAM and AAM modules are marked with a red 'X' and are highlighted with a red box. The AAM module is also marked with a red 'X'.

Module	IPC	BCM	ABS	ATCM	HCM	OCS	PBM	PCM	RCM	RLM	SASM	TCCM	TCM
CAN_HS	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
CAN_MS	✗	?	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
SUB_MOST	✗	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

Additional modules shown in the SUB_MOST category include CDP, FEM, SRM, APIM, and TEL.

Aftermarket Scan Tool Pre-Scan

DTC Details

1. IPC (Instrument Cluster Control Module)(2 DTCs)

Codes	Description	Status
U0159-00	Lost communication with parking assist control module.	Permanent
U0184-00	Lost communication with audio unit.	Permanent

2. BCM (Body Control Module)(1 DTC)

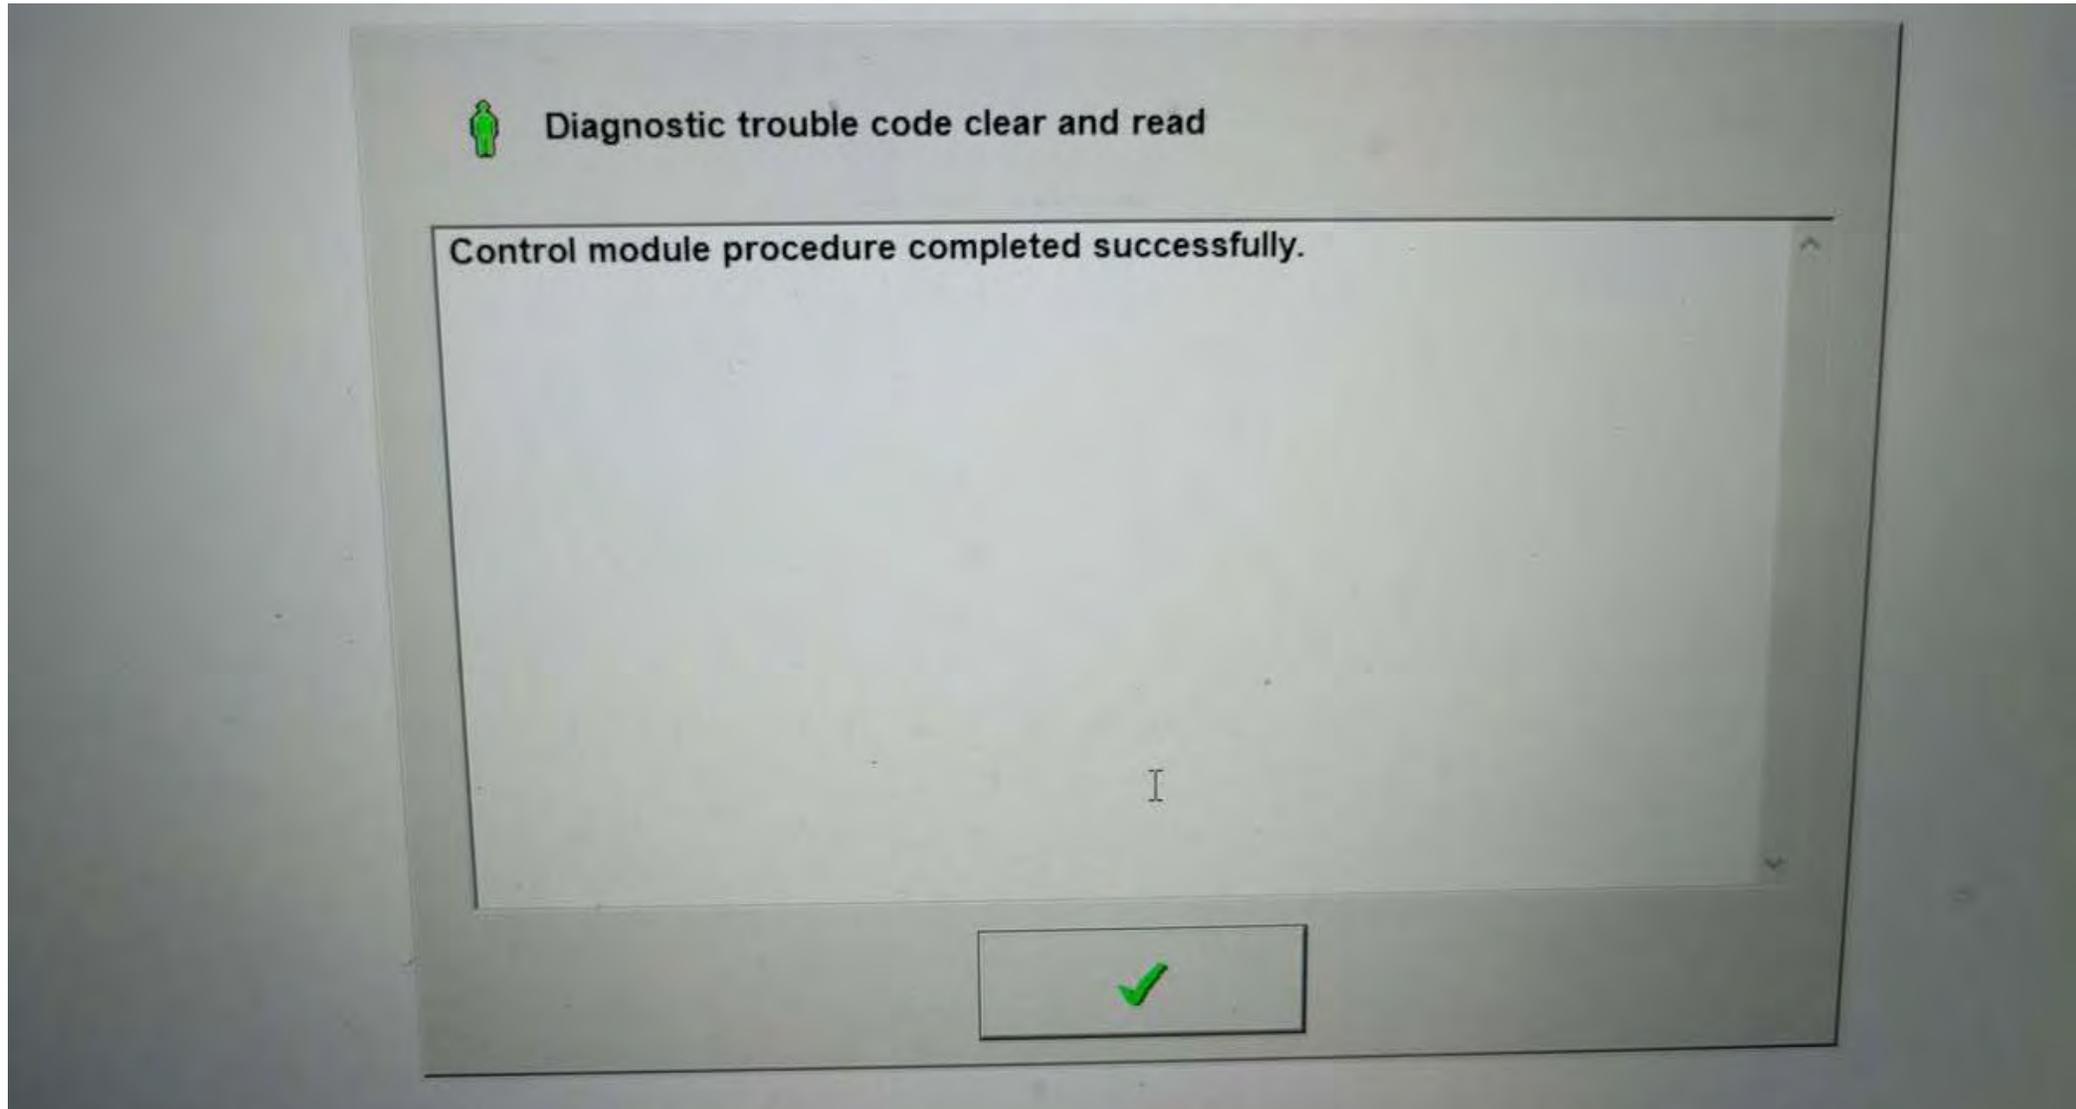

Codes	Description	Status
U0184-00	Lost communication with audio unit.	Permanent

What does a PAM & AAM have in common?

Water !!!

Replace the “Wet” Modules!

After AAM replacement Radio Screen is Blank!

In Conclusion

- **Comms are just voltage... Unless it's MOST!!!**
- **Wires are just wires... Unless it's Light!!!**
- **Learn and understand wiring diagrams**
- **Document everything**
- **Have a process, and most importantly... USE IT!**
